Attachment 1: Aircraft
Attachment 2: Auxiliary Power Usage
Attachment 3: Ground Support Equipment
Attachment 4: Stationary Sources
Attachment 5: Mobile Sources
Attachment 6: Construction
Attachment 7: NEPA Air Quality Protocol and NEPA Climate Protocol

After the publication of the Draft EA, Executive Order 13990, which was relied upon for the January 2023 CEQ draft GHG guidance, was revoked and CEQ revoked its regulations (40 CFR parts 1500-1508) implementing NEPA, 42 U.S.C. 4321 et seq., as amended, in response to Executive Order 14154. In addition, the Supreme Court issued the Seven County Infrastructure Coalition v. Eagle County, 605 U. S. 975 (2025) ruling on May 29, 2025. As a result of these changes, the references to climate, qualitative climate evaluation that discussed the level of preparedness with respect to the impacts of climate change, the extent to which the alternatives could be affected by future climate conditions, and if the alternatives are consistent with national, state, and local climate goals, and the cumulative impact analysis were removed from the Final EA. Though the NEPA Climate Protocol included methodology for both a climate change and cumulative impact analysis, FAA's final decision will only rely upon the GHG emissions disclosed in the Final EA.

Sustainable Airport Master Plan – Near-Term Projects

Air Quality and Greenhouse Gas Technical Report

March 2024

Exhibit 1, Proposed Action 3
Exhibit 2, Landing and Take-Off Cycle 13

1. Introduction

Landrum & Brown completed an air quality and greenhouse gas (GHG)[1] assessment to determine the potential construction and operational impacts to air quality and GHG emissions resulting from the Sustainable Airport Master Plan (SAMP) – Near-Term Projects (NTPs) at the Seattle-Tacoma International Airport (SEA or Airport). This technical report documents the overall approach, methods, and results of the air quality and GHG assessment to demonstrate compliance with the National Environmental Policy Act (NEPA).

This air quality and GHG technical report is organized in the following manner:

- **Air quality** is provided in Sections 2 through 15 which includes the regulatory setting, methodology, emissions inventories, and summary of impacts for criteria pollutants.
- **GHG Emissions** is provided in Section 16 through 22 which includes the regulatory setting, methodology, emissions inventories, and summary of impacts for greenhouse gases.
- Due to the size of the tables and exhibits that substantiate the analysis, they are provided at the end of this technical report as **Attachments,** which are organized in the following order.
  - Attachment 1, Aircraft
  - Attachment 2, Auxiliary Power Unit Usage
  - Attachment 3, Ground Support Equipment
  - Attachment 4, Stationary Sources
  - Attachment 5, Mobile Sources
  - Attachment 6, Construction
  - Attachment 7, NEPA Air Quality Protocol and NEPA Climate Protocol

The approach, methods, and models used in the technical report are consistent with the NEPA Air Quality Protocol and NEPA Climate Protocol (Attachment 7 of this Air Quality and Greenhouse Gas Report) approved by the Federal Aviation Administration (FAA) and the Puget Sound Clean Air Agency (PSCAA).[2,3]

1.1 Description of the Proposed Action

The Port identified a set of NTPs to address the near-term activity levels projected to occur at the Airport. The NTPs include more than 30 projects that would improve efficiency, safety of the Airport, access to the Airport, and support facilities for airlines and the Airport. The NTPs (as a whole) are referred to as the Proposed Action. The elements of the Proposed Action are shown on **Exhibit 1, *Proposed Action*.** The Proposed Action is anticipated to cause emissions from construction and operational activities which necessitates the need for this analysis. Construction refers to the process of building or putting in place the proposed improvements. Operational emissions refer to the emissions emitted once the proposed improvements are operational.

---

1 After the publication of the draft EA, Executive Order (EO) 13990, which was relied upon for the January 2023 CEQ draft GHG guidance, was revoked. In addition, CEQ revoked its regulations (40 CFR parts 1500-1508) implementing NEPA, 42 U.S.C. 4321 et seq., as amended, in response to EO 14154. As a result of these changes, all references to climate and the qualitative climate evaluation that discussed the level of preparedness with respect to the impacts of climate change, the extent to which the alternatives could be affected by future climate conditions, and if the alternatives are consistent with national, state, and local climate goals has been removed from this Technical Report.

THIS PAGE INTENTIONALLY LEFT BLANK

1.2 Alternatives to the Proposed Action

In addition to the Proposed Action, a No Action Alternative was also considered as required under NEPA. The No Action Alternative would include no physical improvements to the Airport, but includes projects that have recently been constructed, or will be constructed by 2037.

The passenger and aircraft operations from the Constrained Operating Growth Scenarios were used for this analysis. The Constrained Operating Growth Scenario is provided in Appendix A, Forecast and Operational Assumptions, of the Environmental Assessment for the SAMP NTPs. Overall, there are more aircraft operations forecast with the Proposed Action as compared to the No Action Alternative. Implementation of the Proposed Action would increase the Airport's ability to accommodate increased aircraft operations and passenger activity by adding aircraft gates and passenger processing facilities.

The analysis also includes an assessment of a Hybrid Terminal Option. This alternative includes the same elements as the Proposed Action but connects the new concourse to the existing Concourse D.

2. Regulatory Setting for Air Quality

2.1 Federal Regulatory Setting

The Clean Air Act (CAA) established the standards and programs used to evaluate, achieve, and maintain acceptable air quality in the United States. Under the CAA, the U.S. Environmental Protection Agency (USEPA) established a set of standards, the National Ambient Air Quality Standards (NAAQS), for six pollutants determined to be potentially harmful to human health and welfare.[4]

- Carbon monoxide (CO);
- Ozone (O_3);
- Nitrogen dioxide (NO_2);
- Sulfur dioxide (SO_2);
- Particulate matter (PM_{10} and $PM_{2.5}$); and
- Lead (Pb).

For each of the criteria pollutants, the USEPA established primary standards intended to protect public health, and secondary standards for the protection of public welfare, which captures factors such as preventing materials damage, preventing crop and vegetation damage, and assuring good visibility. The NAAQS are summarized in **Table 1**.

[4] USEPA, Code of Federal Regulations, Title 40, Part 50 (40 C.F.R. Part 50) National Primary and Secondary Ambient Air Quality Standards (NAAQS), July 2011.

TABLE 1: NATIONAL AMBIENT AIR QUALITY STANDARDS

Pollutant	Primary/ Secondary	Averaging Time	Level	Form Of Measurement
Carbon Monoxide	Primary	8 hour	9 ppm	Not to be exceeded more than once per year
Carbon Monoxide	Primary	1 hour	35 ppm	Not to be exceeded more than once per year
Lead	Primary and Secondary	Rolling 3-month average	0.15 µg/m^3 (1)	Not to be exceeded
Nitrogen Dioxide	Primary	1 hour	100 ppb	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Nitrogen Dioxide	Primary and Secondary	1 year	53 ppb (2)	Annual Mean
Ozone	Primary and Secondary	8 hours	0.070 ppm (3)	Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years
Particulate Matter ($PM_{2.5}$)	Primary	1 year	9.0 µg/m^3	Annual mean, averaged over 3 years
Particulate Matter ($PM_{2.5}$)	Secondary	1 year	15.0 µg/m^3	Annual mean, averaged over 3 years
Particulate Matter ($PM_{2.5}$)	Primary and Secondary	24 hours	35 µg/m^3	98th percentile, averaged over 3 years
Particulate Matter (PM_{10})	Primary and Secondary	24 hours	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide	Primary	1 hour	75 ppb (4)	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Sulfur Dioxide	Secondary	3 hours	0.5 ppm	Not to be exceeded more than once per year

(1) In areas designated nonattainment for the Pb standards prior to the promulgation of the current (2008) standards, and for which implementation plans to attain or maintain the current (2008) standards have not been submitted and approved, the previous standards (1.5 µg/m^3 as a calendar quarter average) also remain in effect.
(2) The level of the annual NO_2 standard is 0.053 ppm. It is shown here in terms of ppb for the purposes of clearer comparison to the 1-hour standard level.
(3) Final rule signed October 1, 2015, and effective December 28, 2015. The previous (2008) O_3 standards are not revoked and remain in effect for designated areas. Additionally, some areas may have certain continuing implementation obligations under the prior revoked 1-hour (1979) and 8-hour (1997) O_3 standards.
(4) The previous SO_2 standards (0.14 ppm 24-hour and 0.03 ppm annual) will additionally remain in effect in certain areas: (1) any area for which it is not yet 1 year since the effective date of designation under the current (2010) standards, and (2) any area for which an implementation plan providing for attainment of the current (2010) standard has not been submitted and approved and which is designated nonattainment under the previous SO_2 standards or is not meeting the requirements of a SIP call under the previous SO_2 standards (40 C.F.R. 50.4(3)). A SIP call is an EPA action requiring a state to resubmit all or part of its State Implementation Plan to demonstrate attainment of the required NAAQS.
Notes: ppm is parts per million; ppb is parts per billion, and µg/m^3 is micrograms per cubic meter.
Source: EPA, https://www.epa.gov/criteria-air-pollutants/naaqs-table, Accessed March 2024.

After EPA sets a new NAAQS or revises an existing standard for a criteria air pollutant, the CAA requires EPA to determine if areas of the country meet the new standards. If the air quality in a geographic area meets or is cleaner than the national standard, it is called an attainment area (designated “attainment/unclassifiable”); areas that don't meet the national standard are called nonattainment areas. In some cases, EPA is not able to determine an area's status after evaluating the available information and those areas are designated "unclassifiable." A maintenance area is an area previously designated nonattainment that subsequently meets the requirements in the CAA Section 107(d)(3). Such an area remains designated as maintenance for a period of up to 20 years provided that the NAAQS were sufficiently maintained throughout the maintenance period. Once designations take effect, state and local governments with nonattainment areas must develop State Implementation Plans (SIPs) outlining how areas will attain and maintain the standards by reducing air pollutant emissions.

Section 176(c) of the CAA requires federal actions to conform to the appropriate SIPs in order to attain the CAA’s air quality goals. To address this, EPA promulgated a Transportation Conformity Rule (40 Code of Federal Regulations [C.F.R.] Part 93, subpart A) and a General Conformity Rule (40 C.F.R. Part 93, subpart B). The Transportation Conformity Rule does not apply for this analysis because the Proposed Action will not be funded through U.S.C. Title 23 or the Federal Transit Act.

Most actions by the FAA fall under the General Conformity provisions of the CAA.[5] The General Conformity Rule under the CAA is conducted in three phases, depending on the extent of the proposed federal action: (1) applicability, (2) evaluation, and (3) determination. The applicability phase has two parts. The first part is to determine if the Proposed Action is located in a USEPA-designated nonattainment or maintenance area for one or more of the regulated criteria pollutants. If it is not, then the General Conformity Rule does not apply. Since the Proposed Action is not located in a USEPA-designated nonattainment or maintenance area for one or more of the regulated criteria pollutants, the General Conformity Rule does not apply.

2.2 State Regulations

In addition to federal requirements, the Airport is subject to state and local air quality regulations that the Washington State Department of Ecology and PSCAA enforce, respectively. Based on the Air Quality Data Summary for 2022 prepared by the PSCAA, the State of Washington and the Puget Sound region have adopted the EPA’s NAAQS.[6,7]

2.3 King County Air Quality Status

The Airport is located within King County, Washington, which is included in the Puget Sound Intrastate Air Quality Control Region. As previously stated, the Proposed Action would occur in areas that are currently in attainment for all criteria pollutants.

---

5 General Conformity ensures that the actions taken by federal agencies, such as airport construction, do not interfere with a state’s plans to attain and maintain national standards for air quality. Additional information for General Conformity can be found on-line: https://www.epa.gov/general-conformity

6 Puget Sound Clean Air Agency. 2022 Air Quality Data Summary, December 2023. Available on-line: https://pscleanair.gov/DocumentCenter/View/5360/Air-Quality-Data-Summary-2022-PDF?bidId=

7 The Puget Sound Clean Air Agency has developed an air quality health goal for daily $PM_{2.5}$ concentrations. The health goal of 25 µg/m^3 for a daily average is more protective than the current federal standard of 35 µg/m^3. However, the State of Washington has not approved this health goal as an ambient air quality standard. The goal is not enforced by regulation but a standard the state is voluntarily trying to achieve beyond the federal standard.

For background information, the area was previously designated maintenance for ozone under the 1-hour 1979 ozone standard; however, the 1-hour standard was revoked by the EPA effective June 15, 2005. The maintenance period for ozone ended on October 25, 2016.[8] The region is currently designated as in attainment for both the 2015 and 2008 8-hour ozone standard. The region is not subject to a maintenance plan for ozone, although ozone has been considered an important pollutant tracked by the state and local agencies.

In the past, King County was also designated as nonattainment for carbon monoxide (CO); however, on October 11, 1996, the EPA determined the area had attained the standard and the region was re-designated to attainment. The maintenance period for CO ended on October 11, 2016.[9] Several areas within King County are classified as maintenance for the PM_{10} (coarse particles) standard, including Kent, Duwamish and Tacoma. Neither the Proposed Action nor any part of the Airport is within any of these areas. Therefore, the Proposed Action would occur in an area considered in attainment for all criteria pollutants.

3. Overall Approach for Air Quality Assessment

The overall approach to conducting this air quality analysis follows FAA guidelines for preparing NEPA documents, which includes FAA Order 1050.1F, *Environmental Impacts: Policies and Procedures (including the Desk Reference);* FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*; and FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1.* In accordance with these orders, the overall approach and goal of the air quality impact analysis is to meet the requirements of NEPA and the CAA.

- NEPA: Compliance with NEPA is accomplished by disclosing the potential emissions associated with the Proposed Action. This includes preparation of emission inventories of both construction activities and operational conditions for the Proposed Action, any development alternatives, and the No Action Alternative. NEPA also requires that the project is shown qualitatively or quantitatively as to not cause, or contribute to, violations of the NAAQS.
- CAA: The CAA requires that project emissions do not cause or contribute to violations of the NAAQS. In nonattainment and maintenance areas, a project's compliance with this requirement can be demonstrated by showing that the project emissions are *de minimis* or that they conform to the SIP for achieving and maintaining the NAAQS.

As previously discussed, the Proposed Action would occur in areas that are currently in attainment for all criteria pollutants; therefore, conformity does not apply. Per the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1,* when an action is not located in an EPA-designated nonattainment or maintenance area, the comparison of the emission inventories is used for disclosure purposes. Comments received during scoping were taken into consideration by the FAA in the development of the methodology and protocol document for this air quality and GHG analysis.

[9] Ibid.

4. Air Quality Methodology

The air quality assessment included an evaluation of operational activities for the Existing (2022) Condition; and the Proposed Action, No Action Alternative, and the Hybrid Terminal Option for the projected future conditions in 2032 and 2037. The year 2032 will be used as a basis for analysis because 2032 is the projected opening year of the Proposed Action. In addition, 2037 will be used as a basis for analysis, because it represents a condition five years beyond the opening year.[10] The air quality analysis will also disclose the potential air quality impacts due to construction activities during the years 2025 to 2032. Because the area of the Proposed Action is in attainment and conformity does not apply, no potential SIP milestone years will be analyzed.

4.1 Models Used in the Emissions Analysis

Operational emissions were evaluated using the FAA's Aviation Environmental Design Tool (AEDT) Version 3f.[11] AEDT models aircraft performance in space and time to estimate fuel consumption, air quality emissions, and noise consequences at airports. The EPA's Motor Vehicle Emissions Simulator version 4 (MOVES4) was used to develop the emissions inventory for motor vehicles on roadways that may be affected by the Proposed Action.[12] MOVES is an emission modeling system that estimates emissions for mobile sources at the national, county, and project level for criteria air pollutants, greenhouse gases, and air toxics.

Construction emissions were evaluated using the Airport Construction Emissions Inventory Tool (ACEIT) to estimate the type of construction equipment, horsepower, load factor, and operating hours for each project element and phase. The EPA's MOVES4 was used to identify the emission factor of each criteria and greenhouse gas pollutant for each construction equipment type.

4.2 Criteria Pollutants

The analysis included the following EPA criteria air pollutants: carbon monoxide (CO), nitrogen dioxide (NO_2), coarse particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and sulfur dioxide (SO_2). Ozone is not directly emitted from a source. Rather, ozone is formed through photochemical reactions involving emissions of the precursor pollutants nitrogen oxides (NO_x) and volatile organic compounds (VOCs) in the presence of abundant sunlight, and heat. Therefore, emissions of ozone are not directly provided; however, emissions are disclosed for the ozone precursor pollutants, NO_x and VOCs.

While some active general aviation airports prepare lead emissions inventories due to use of leaded Avgas, this is not warranted for SEA because: 1) the area is in attainment for lead, 2) Avgas (the only aviation fuel containing lead) fueling ceased at SEA in 2018, and 3) the Proposed Action does not involve any potentially significant source of lead emissions.

---

10 The FAA's Desk Reference Section 11.3 states "The environmental consequences section of the NEPA document will include the analysis of the potential noise impacts of the proposed action and alternative(s) for each timeframe evaluated… Timeframes usually selected are the year of anticipated project implementation and 5 to 10 years after implementation." The FAA's Desk Reference Section 1.3.2 for air quality states, "the emissions inventory usually is calculated for the year(s) of project implementation, the planning horizon year(s) in the EA or EIS, and sometimes for intermediate years, if appropriate due to project phasing or if requested by a reviewing agency." The air quality analysis would be conducted consistent with the noise analysis and therefore include an assessment of the implementation year and of the project five years after implementation.

11 The latest version of the FAA's AEDT is version 3f, which was released on December 15, 2023.

12 The EPA released MOVES4 in August 2023. (FR Vol. 88, No. 175 September 12, 2023).

4.2.1 Pollutants Not Included

4.2.1.1 Hazardous Air Pollutants

Hazardous air pollutants (HAPs) are pollutants for which there are no NAAQS but are still regulated under the federal CAA because of their potentially adverse effects on human health and the environment. Per FAA guidance provided in the *Aviation Emissions and Air Quality Handbook Version 3 Update 1*, a HAPs emissions inventory should be considered if the Proposed Action is considered "major" (e.g., new airport, new runway, major runway extension, etc.); if the Proposed Action is located in a nonattainment or maintenance area; and/or if a criteria air pollutant emissions inventory is also prepared. A HAPs inventory analysis will not be conducted as part of the NEPA assessment because the Proposed Action is not considered a "major" action (e.g., new airport, new runway, major runway extension, etc.) and is not located in a nonattainment or maintenance area.

4.2.1.2 Ultrafine Particles

Ultrafine particles (UFPs) are defined as particles with a diameter less than 0.1 micrometers ($PM_{0.1}$). The existing science is not fully mature, and the measurement and understanding of UFPs and their related health risks has not been clearly defined. Currently UFPs are not regulated by the EPA or the state either through rate of emissions or concentrations (other than being a subset component of $PM_{2.5}$) and are therefore not typically considered in formal reviews. Furthermore, since UFPs are not specifically listed as a criteria pollutant, air toxic, or HAP, an analysis of UFPs is not a requirement of NEPA or the CAA. Therefore, no analysis or discussion of UFPs was included in the NEPA evaluation.

4.3 Sources of Emissions

The following sources of emissions are included in this analysis.

- Aircraft
  - Landing and Take-off Cycles (Engine Start-Up, Approach, Climb, and Taxi)
  - Auxiliary Power Units (APUs)
  - Aircraft Run-Ups
- Ground Support Equipment (GSE)
  - Airline/Tenant-owned GSE
  - Port-owned airfield vehicles and equipment
- Stationary Sources
  - Natural Gas Boilers and Heaters
  - Diesel Generators
  - Fuel Farm Tanks
- Motor Vehicles
  - On and Off-Airport roadways and Parking Lots (including Port-owned roadway vehicles)
  - Airside Contractor and Delivery Vehicles
- Construction Activity
  - On-road activity including construction employee vehicle trips and material delivery/hauling trips
  - Off-road activity including use of construction equipment such as excavators, graders, and pavers

4.4 Data Used in the Analysis

A wide range of data is needed for input into the models previously identified. Sources of information on operation of the Airport and the Proposed Action are:

- FAA's Air Traffic Activity System (ATADS) was used to identify the total aircraft operations by FAA categories of activity in 2022. The ATADS data are available to the public on FAA's website.[13]
- The Port's Constrained Operating Growth Scenarios represents the best projection of how aviation activity growth will occur over time with and without the NTPs.[14] This was used to identify the total number of operations for the No Action and Proposed Action in 2032 and 2037.
- The Port's EnvironmentalVue Flight Track Monitoring System[15] data for the period January 2022 through December 2022 was used to identify information about each flight, time of day, airline, and aircraft type. Data from the EnvironmentalVue Flight Track Monitoring System is available to the public by specific request to the Port.
- Diio Mi[16] was used to identify the engine type for the various airline/operator for the specific aircraft type. The Diio Mi database is available by paid subscription only.
- The tenant-owned GSE was determined by conducting a GSE survey (i.e., field verification and Port of Seattle data) to identify equipment types and usage for passenger and cargo aircraft. The AEDT model's default GSE were used to assign GSE defaults for general aviation aircraft operations. Usage for the future conditions was based on the increases in aircraft levels.
- Port-owned airfield vehicles and equipment usage was obtained from the Port. Usage for future conditions was adjusted based on the increases in aircraft levels.
- The AEDT database was used to assign the APU equipment type for each aircraft type. The APU usage for Existing (2022) Condition and for future conditions was based on the Port of Seattle's Rules and Regulations.
- For off-Airport roadways, existing and future conditions information from the surface transportation study developed for the NEPA Environmental Assessment (EA) was used. Where data was not collected for roadway segments within the study area, Washington Department of Transportation (WSDOT) data was utilized. For on-Airport roadways in the Existing (2022) Condition, Port information on the number and types of airside delivery vehicles accessing the airfield through security gates was used. For future conditions, the vehicles were increases based on the increase in passenger levels.
- Emissions factors from AEDT and MOtor Vehicle Emission Simulator (MOVES) were used for the respective time periods (2022, 2032, and 2037).
- Construction information including the phasing schedule was provided by the Port and is included in Attachment 6.

13 FAA's website https://aspm.faa.gov/opsnet/sys/Main.asp. Accessed July 2023.
14 Constrained Operating Growth Scenario, prepared by Port of Seattle/Landrum & Brown, 2023.
15 EnvironmentalVue is a secure, web-based application that provides flight track information to the Port of Seattle.
16 Diio Mi is a comprehensive web-based collection of critical data sources designed for aviation professionals used to analyze the airline market. This tool available by paid subscription only includes worldwide schedule data, both historical and future; U.S. Departments of Transportation traffic, fare, load factor, financial, and on-time performance data; and industry fleet information.

5. Existing (2022) Condition

The Existing (2022) Condition is provided for background and context only.

5.1 Aircraft

5.1.1 Aircraft Fleet Mix and Activity Level

The number and type of aircraft operations directly affect emissions. Aircraft emissions depend partly on the physical characteristics and performance parameters of each aircraft. This includes the airframe type and the type and number of engines. In order to calculate emissions from aircraft, information concerning aircraft operations was collected from FAA's ATADS. According to FAA data, there were 401,351 total annual operations at the Airport during 2022.

ATADS data only provides annual operations by FAA general category (air carrier, air taxi,[17] general aviation, and military). The Port's EnvironmentalVue Flight Track Monitoring System was used to identify the specific aircraft types, operation type, and the aircraft operators. From this information, the types of operations and a specific aircraft code were determined. Specific airframe and engine combinations were developed from the Diio Mi database. Annual operational totals derived from EnvironmentalVue for each airframe engine combination were scaled to match the ATADS annual operational total of 401,351. The scaling was based on each airframe engine combination's percentage of total operations reported in EnvironmentalVue. This scaling results in fractional annual operational totals for each of the airframe engine combinations. Table 1-1 in Attachment 1 presents the annual operations with the AEDT airframe and engine code modeled for the Existing (2022) Condition.

5.1.2 Aircraft Approach and Climb

In addition to the physical characteristics of the aircraft operating at the Airport, emissions further depend on the time that each aircraft type operates in the various modes that define a landing and take-off cycle (LTO). According to the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*, an LTO generally consists of the approach, landing, taxi into the gate/terminal/or parking area, start-up, taxi out, take-off, and climb. **Exhibit 2, *Landing and Take-Off Cycle*** provides an illustration of the LTO. The approach and climb portions of the LTO only go from or to the mixing height, or 3,084 feet AFE.[18] Emissions that occur within the LTO are quantified by adding the AEDT Climb Below Mixing Height and Descend Below Mixing Height values.[19]

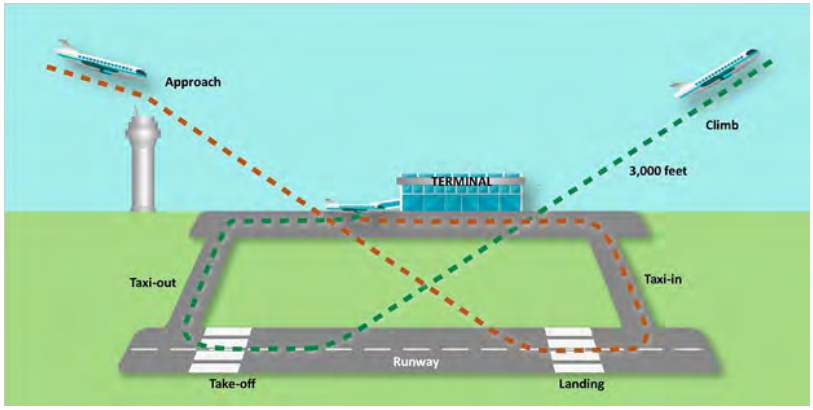
---

17 FAA defines air taxi as an aircraft designed to have a maximum seating capacity of 60 seats or less or a maximum payload capacity of 18,000 pounds or less carrying passengers or cargo for hire or compensation. Definition available at: https://aspm.faa.gov/aspmhelp/index/Glossary.html

18 The mixing height used in this assessment is defined as 3,084 feet in altitude above field elevation, which is the recommendation by the FAA based on the USPEA's *Mixing Heights, Wind Speeds, and Potential for Urban Air Pollution Throughout the Contiguous United States*. Available on-line: https://nepis.epa.gov/Exe/ZyNET.exe/20013CDS.TXT?ZyActionD=ZyDocument&Client=EPA&Index=Prior+to+1976&Docs=&Query=&Time=&EndTime=&SearchMethod=1&TocRestrict=n&Toc=&TocEntry=&QField=&QFieldYear=&QFieldMonth=&QFieldDay=&IntQFieldOp=0&ExtQFieldOp=0&XmlQuery=&File=D%3A%5Czyfiles%5CIndex%20Data%5C70thru75%5CTxt%5C00000005%5C20013CDS.txt&User=ANONYMOUS&Password=anonymous&SortMethod=h%7C-&MaximumDocuments=1&FuzzyDegree=0&ImageQuality=r75g8/r75g8/x150y150g16/i425&Display=hpfr&DefSeekPage=x&SearchBack=ZyActionL&Back=ZyActionS&BackDesc=Results%20page&MaximumPages=1&ZyEntry=1&SeekPage=x&ZyPURL

19 For more detailed information and definition of AEDT terms, the AEDT user's guide may be accessed at https://aedt.faa.gov/

EXHIBIT 2, LANDING AND TAKE-OFF CYCLE



Source: Landrum & Brown, 2023.

5.1.3 Aircraft Taxi Time

The amount of time an aircraft spends taxiing affects emissions. The taxi in and taxi out time is dependent on the airfield configuration, annual operating levels, and available facilities. The average taxi in and taxi out time for the existing conditions was based on the FAA's operations and performance data for SEA including Aviation System Performance Metrics (ASPM) in 2022. The average taxi in time was ten minutes and 16 seconds and the average taxi out time was 18 minutes and 53 seconds for the Existing (2022) condition, for a total of 29 minutes and ten seconds.

5.1.4 APUs

Most of the larger jet aircraft use APUs (turbine engines in the tails of aircraft that burn jet fuel) to operate the heating, air conditioning, and electric systems when the main aircraft engines are not running. The APU is also used to 'start-up' or restart the aircraft engines before departing from the gate or cargo area.

APUs typically remain in use while the aircraft is parked and serviced, unless an alternative source of electricity and pre-conditioned air (PC Air) is made available. The Port has installed PC Air and a fixed power supply at most of the passenger terminal gates. These features allow pilots to avoid using the APU while the aircraft are parked at the gate. However, APU usage is within the control of the pilot; therefore, APU use and emissions can vary greatly from one airline/operator to another and even one aircraft to another.

Furthermore, the use of hardstand and cargo operations (when aircraft are not using gates and jet bridges) impacts the usage of APUs. In addition to PC Air and a fixed power supply being installed at the terminal gates, there are portable ground power units (GPUs) that are used for cargo and hardstand operations. Emissions from portable GPUs are disclosed in the GSE section.

For the existing conditions analysis, the AEDT database was used to assign the specific types of APU used for each aircraft type and the Port of Seattle's Rules and Regulations will be used to assign APU usage for passenger and cargo operations. In June 2020, the Port updated their rules and regulations for airfield operations.[20] Effective January 1, 2021, aircraft operators are required to use 400Hz ground power and PC Air sources where available and practicable. Operators are required to connect to those sources and discontinue APUs promptly (within seven minutes) after chocking the aircraft wheels upon

[20] The Port of Seattle has the ability to enforce the rules and regulations on tenants through lease agreements.

parking. In addition, the Port requires aircraft operators to limit APU use to 15 minutes for International Civil Aviation Organization (ICAO) type Code C[21] aircraft; or to 25 minutes for ICAO type Code D[22] or above aircraft prior to departure.[23]

General aviation operations were assigned the AEDT default APU equipment and usage as there is no single operator for these operations and the Port of Seattle's Rules and Regulations do not have any requirements for general aviation aircraft. In addition, some of the smaller aircraft in the general aviation operation category do not have or use APUs. See Table 2-1 in Attachment 2 for the estimated annual APU usage for the Existing (2022) Condition.

5.1.5 Aircraft Run-Ups

Emissions from aircraft run-up operations were included for the Existing (2022) Condition. Aircraft engine ground run-ups are routine aircraft engine maintenance tests performed to test engines and diagnose engine issues. Aircraft run-up activity logs were provided by the Port to determine the amount of run-up operations, the location of the run-up, average duration, and the associated airframe and engine. A total of 477 run-up operations were reported in the run-up activity logs for the Airport in 2022.

5.2 Ground Support Equipment (GSE)

5.2.1 Tenant-Owned GSE

Most of the GSE at the Airport is owned and operated by the individual airlines and service providers contracted by the airlines, not the Port. Typical tenant-owned GSE includes baggage tractors, belt loaders, and catering vehicles that support aircraft operations.

The Port has installed over 400 charging points/stations for electric ground support equipment (eGSE) throughout the Airport across all terminals. As such, a GSE survey was conducted to inform the modeling of tenant-owned GSE to account for the use of eGSE. The survey included the field verification and review of Port data to identify the most commonly used GSE types and duration of usage for a select group of representative aircraft by airline operating at the Airport. The results of the survey were used to develop the AEDT inputs for GSE by aircraft operation. Operational emissions from vehicles such as catering trucks that operate on airport roadways beyond the immediate vicinity of the aircraft were quantified in the motor vehicle emissions inventory.

Table 3-1 in Attachment 3 provides the tenant-owned GSE modeled for the Existing (2022) Condition.

5.2.2 Port-Owned Airfield Vehicles and Equipment

The Port owns and operates various vehicles and equipment for airfield maintenance purposes and to support hardstand operations at the Airport. These vehicles include pickup trucks, snowplows, belt loaders, forklifts, shuttle buses, trimmers, and pressure washers. Data was obtained from the Port on the use of Port-owned airfield vehicles and equipment to develop the emissions inventory for the Existing (2022) Condition. Only the vehicles used primarily on the airfield were included in this portion of the inventory, while the Port-owned airfield vehicles that primarily operate on roadways were included in the motor vehicle emissions inventory later in this report. In order to determine emissions,

---

21 ICAO Annex 14, Seventh Edition – July 2016 define Code C aircraft as having a wingspan of 24 meters up to but not including 36 meters. The outer main gear wheel span is 6 meters up to but not including 9 meters.

22 ICAO Annex 14, Seventh Edition – July 2016 define Code D aircraft as having a wingspan of 36 meters up to but not including 52 meters. The outer main gear wheel span is 9 meters up to but not including 14 meters.

23 Port of Seattle, Schedule of Rules and Regulations No. 5, Effective February 12, 2015. Updated June 9, 2020. https://www.airportprojects.net/sampenvironmentalreview/rules-and-regs-9-1-23/.

all of the various types of Port-owned airfield vehicles and equipment were grouped to representative AEDT equipment types to be modeled. For example, all of the gasoline Ford F150 pickup trucks were included in the gasoline F250/F350 Service Trucks AEDT equipment category. Table 3-2 in Attachment 3 provides the estimated fuel consumption for the Port-owned airfield vehicles and equipment for the Existing (2022) Condition.

5.3 Stationary Sources

Stationary sources of emissions include generators, boilers and heaters, and fuel tanks located on airport property which may be affected by the Proposed Action. Emissions from purchased electricity generated off-site are not included in the criteria pollutant emissions inventory per the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*. Data was obtained from the Port on the existing use of stationary sources to develop an inventory of boilers and heaters, generators, and fuel tanks for the Existing (2022) Condition.

5.3.1 Natural Gas Boilers and Heaters

Table 4-1 in Attachment 4 provides the location, equipment type, and usage of the natural gas boilers and heaters modeled for the Existing (2022) Condition. The Port collects the data in therms, which were converted to 1000s of meters cubed for input into the AEDT model.

5.3.2 Diesel Generators

The Airport operated 31 diesel generators in 2022 to supply standby and emergency power. Emissions from the use of the generators were based on how many hours a year each generator was operated. The annual hours of operation for each diesel generator were provided by the Port. Table 4-2 in Attachment 4 provides the location, description, horsepower, and annual usage (hours) of diesel-powered generators for the Existing (2022) Condition.

5.3.3 Fuel Farm Tanks

According to data from the Port, the total volume of aviation fuel (Jet A) that was supplied to aircraft at the Airport in 2022 was 595,696,138 gallons, which was stored among eight fuel tanks located at the Airport's fuel farm. Fuel storage in the fuel tanks was modeled in AEDT as a stationary source and therefore was a source of evaporative emissions resulting in VOC emissions.

5.4 Motor Vehicles

Motor vehicles include airport passenger vehicles; vehicles transporting airport and tenant employees; and vehicles transporting cargo to and from the Airport. The consideration of motor vehicle emissions typically focuses on identifying where and how a Proposed Action and its alternatives may affect surface travel (including the number and types of vehicles). For this analysis, the study area is the same as the surface transportation study developed for this EA. The study area boundary is shown in Exhibits 5-1 through 5-11 in Attachment 5. The following section describes the data used to estimate the number and types of vehicles occurring in the study area.

5.4.1 Motor Vehicles (On- and Off-Airport Roadways)

Emissions from motor vehicles traveling on and off-airport roadways are a function of the vehicle-miles-traveled (VMT) within a specific roadway segment by a specific type of vehicle and the emission factor. Vehicle types such as passenger cars and long-haul trucks, have different emission factors. In addition, vehicles traveling at different rates of speed have different emission factors. The following provides a

summary of the approach taken to document emissions from motor vehicles on roadways. The approach taken for vehicles in parking facilities is discussed separately.

1. Roadway segments were defined for both on- and off-airport roadways. These included roadway segments where it is reasonable to anticipate changes in vehicle traffic from the Proposed Action. Distances for each roadway segment were calculated. The speeds in miles per hour (mph) on these roadway segments were based on the surface transportation study where data was available and, where data was not available, posted speed limits were used.
2. Average annual daily traffic data on the roadway segments was collected from the surface transportation study, the Port, and the Washington State Department of Transportation.[24] The data obtained was utilized to estimate VMTs. The distance of the roadway segment was multiplied by the traffic volume to determine the daily VMT for each segment, which was then converted to annual VMT by multiplying the daily VMT by 365. See Attachment 5 for the VMTs on each roadway segment.
3. Emission factors were determined for various speeds for different vehicle groups using EPA MOVES4.
4. All vehicle types were grouped into four main categories based on similar engine and operating characteristics in order to assign an emission factor. The vehicle distribution (vehicle mix) on each roadway segment was developed based on King County data contained in MOVES4.
5. Emissions were calculated by multiplying the annual VMT of each roadway segment by the emission factor using the specific vehicle distribution.

5.4.1.1 Roadway Segments

For the Existing (2022) Condition, the roadway segments were grouped together into ten areas where it is reasonable to anticipate changes in vehicle traffic due to the Proposed Action. The roadway segments are shown in Exhibits 5-1 through 5-11 in Attachment 5. The following provides a general description of each area.

- **Area 1** is located north and northwest of the Airport. This area contains State Route 518, Des Moines Memorial Drive S, and 24th Avenue S., and was included to capture traffic accessing the Airport from the north.
- **Area 2** is located north and east of the Airport. This area contains Air Cargo Road, Airport Expressway, State Route 99, Southcenter Boulevard, and Military Road S. These roads were selected to capture traffic accessing the Airport from the north and the east.

[24] Peak hour average day data provided specifically from the Port were converted to average annual daily traffic volumes (AADT). Based on 2022 vehicle traffic data and the conversion of peak hour average day to average annual day provided by the Port of Seattle, peak hour was multiplied by 316.5 instead of 365 to get an average annual day.

- **Area 3** is located east of the Airport, including the main terminal and parking facilities. This area contains the curb front roads used to access the Airport from the north, including Airport Expressway, Arrivals Dr, Departures Dr, Air Cargo Road, S. 170th Street, and State Route 99/Tukwila International Boulevard. These roads were selected to capture traffic accessing the Airport from the north and south.
- **Area 4** is located south of the Airport. This area contains South 188th Street, 28th Avenue, South 192nd Street, and State Route 99. These roads were selected to capture traffic accessing the Airport from the east and south.
- **Area 5** is located west of the Airport, including State Route 509/Des Moines Memorial Drive S, S Normandy Rd, and South 186th Street. These roads were selected to capture traffic accessing the Airport from the west.
- **Area 6** is located west of the Airport, including State Route 509/Des Moines Memorial Dr S, S Normandy Rd, and S 156th Street, and S 156th Way/154th Street. These roads were selected to capture traffic accessing the Airport from State Route 509.
- **Area 7** is located east of the Airport, including S 189th St, Military Rd S, and S 176th St. This also includes a segment of Interstate 5 south of SR 518These roads were selected to capture traffic accessing the Airport from Interstate 5.
- **Area 8** is located southeast of the Airport, including State Route 99, S 200th St, and 28th Ave S. These roads were selected to capture traffic accessing the Airport from the south and from Interstate 5.
- **Area 9** is located south of the Airport, including S 200th St, S 216th St, and Des Moines Memorial Drive S. These roads were selected to capture traffic accessing the Airport from Des Moines Memorial Drive S.
- **Area 10** is located east of the Airport, including Interstate 405, State Route 518, and Southcenter Blvd. These roads were selected to capture traffic accessing the Airport from Interstate 405 and Southcenter Blvd.

5.4.1.2 Vehicle Classification

In order to determine emissions, all of the various types of vehicles operating on and off-airport roadways were grouped into four main vehicle classifications according to MOVES in order to assign an appropriate emission factor. **Table 2** provides the vehicle classifications used in the Existing (2022) Condition.

TABLE 2: VEHICLE CLASSIFICATIONS

MOVES Database Classification	General Vehicle Description
Passenger Car (PC)	Includes passenger cars, rental cars, employee cars, taxis, motorcycles
Passenger Truck (PT)	Includes light duty pickup trucks, vans
Short-Haul Truck (SHT)	Includes buses, shuttle buses, hotel shuttle buses, box trucks, refuse trucks, single unit trucks, medium duty trucks
Long-Haul Truck (LHT)	Includes heavy duty trucks, fueling trucks, tractor trailers

Source: L&B 2023 and MOVES4 database classifications.

5.4.1.3 Vehicle Distribution

The EPA's MOVES model was used to estimate vehicle distribution of the different vehicle classifications on roadways specific to King County.[25] **Table 3** provides the vehicle distribution that was used for the Existing (2022) Condition.

TABLE 3: VEHICLE DISTRIBUTION ON KING COUNTY ROADWAYS

County	Passenger Car (%)	Passenger Truck (%)	Single Unit Short-Haul Truck (%)	Long-Haul Truck (%)
King County	44.6	44.6	5.4	5.4

Note: See Table 2 for description of vehicle classifications.
Source: MOVES4, 2024.

There are several roadways that are known by the Port to have a different vehicle distribution than the King County average because of passenger and cargo operations supporting aircraft activity. The Port collects specific data concerning vehicles on these roadways. The Port collected data on the types of and number of vehicles operating on Airport Drives, S. 170th Street, and Air Cargo Road. **Table 4** provides the vehicle distribution as a percentage, used for these specific roadway segments.

TABLE 4: VEHICLE DISTRIBUTION ON AIRPORT-SPECIFIC ROADWAYS

Roadway Description	Passenger Car (%)	Passenger Truck (%)	Single Unit Short-Haul Truck (%)	Long-Haul Truck (%)
Airport Drives (South of 170th)	46.0	46.0	6.9	1.1
S. 170th St. (Between Air Cargo Road and the Expressway)	39.0	39.0	21.0	1.0
Air Cargo Road (Between S 170th St and the Expressway)	38.5	38.5	22.0	1.0
Air Cargo Road (Between the Expressway and S. 166th St.)	41.0	41.0	17.0	1.0
Airside Deliveries	0.0	63.1	36.0	0.9

Note: See Table 2 for description of vehicle classifications.
Source: Port of Seattle, 2023.

5.4.1.4 Traffic Volumes

Data was collected on the traffic volumes for the roadway segments in the Existing (2022) Condition from the Port and the Washington State Department of Transportation. The distance of the roadway segment, as measured using a geographic information system (GIS) mapping tool, was multiplied by the traffic volume to determine the daily VMT, which was converted to annual VMT by multiplying by 365 for each segment. The traffic volumes for each roadway segment are provided in Table 5-1 in Attachment 5. Approximately 1,004,717,456 annual VMTs were estimated for the Existing (2022) Condition.

[25] The vehicle distribution for air quality utilized specific Port data and King County averages from MOVES4. The surface transportation analysis also presented in this EA utilized peak hour values for the Synchro analysis, which was based on the 2022 intersection counts and was not applicable for this purpose.

5.4.1.5 Airside Delivery Vehicles

Information on the number and types of airside delivery vehicles accessing the airfield through security gates was obtained from the Port. There were three main access points for deliveries, with negligible travel differences between them. A distance of two miles, as measured with GIS, was applied to all the airside delivery vehicles. An average speed of 15 mph was assumed for vehicles making airside deliveries.

5.4.1.6 Emission Factors

The EPA's MOVES4 was used to compute motor vehicle emissions rates in grams of pollutant per vehicle mile traveled (g/VMT). The emission factors are unique to King County and are different for each criteria pollutant, speed, and vehicle type. The emission factors for each pollutant by speed and vehicle type are provided Table 5-2 in Attachment 5.

5.4.2 Motor Vehicles (Parking Facilities)

Emissions from parking facilities where it is reasonable to anticipate changes in vehicle traffic due to the Proposed Action are included in the Existing (2022) Condition emissions inventory. Emissions are based on volumes of vehicles in the parking facilities, distance traveled within the parking facility, and speed of vehicles. Volumes for the Doug Fox Lot were estimated assuming the lot operated at full capacity meaning there are vehicles in all of the stalls.[26] For the main parking garage and the North Employee Parking Lot, parking lot transaction data was obtained from the Port. The volume data for the main parking garage contained information on employee traffic (identified as Corporate) and passenger vehicles (identified as Terminal and Direct). Distance for a vehicle to travel was mapped using GIS on the length from the first parking stall from the entrance to the last stall using every aisle and floor if applicable. The main parking garage is eight stories, with employee parking on floors one (ground level) and two and passenger parking on floors one through eight. The average calculated distance traveled for vehicles in the main parking garage was 0.96 miles, the average distance traveled by vehicles in the Doug Fox Lot was 0.80 miles, and the average distance traveled by vehicles in the North Employee Parking Lot was 4.24 miles. In order to determine emissions, an average speed of 5 mph was assumed for vehicles in the main parking garage, the Doug Fox Lot, and the North Employee Parking Lot.

5.5 Existing (2022) Condition Criteria Pollutant Emissions Inventory

The emissions inventory for the Existing (2022) Condition is shown in **Table 5** and provides the total annual pollutant emissions as short tons per year.[27] The Existing (2022) Condition emissions inventory shows the pollutants with the greatest emissions are CO and NO_x. There were approximately 5,178 tons of CO and 2,537 tons of NO_x emitted in 2022. These pollutants are produced from the incomplete combustion of aircraft and motor vehicle engines. Motor vehicles produce the greatest contribution to CO emissions (61.2 percent) while aircraft produce the greatest contribution to NO_x emissions (82.0 percent).

[26] A daily turnover rate of 1.0 means a car is there all day long. A daily turnover rate of 4.0 is used for quick turn-overs experienced at grocery stores and banks. No specific turnover rate was available, therefore for this analysis, a daily turnover rate of 2.5 was applied based on professional judgment.

[27] A short ton in the United States is commonly just called a ton. One short ton equals 2,000 pounds.

TABLE 5: ANNUAL OPERATIONAL EMISSIONS INVENTORY - EXISTING (2022) CONDITION

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
Aircraft	**1,798**	**255**	**2,081**	**186**	**21**	**21**
LTO (includes Start-Up, Approach, Climb, and Taxiing)	1,681	244	1,977	175	12	12
Aircraft Run-Ups	1	0	44	2	0	0
APUs	116	10	60	9	9	9

Source: Port of Seattle and L&B, 2024.

6. Construction Emissions Inventories

Temporary air quality impacts would result from construction activities associated with the Proposed Action and the Hybrid Terminal Option. Air pollutants would be emitted by construction equipment and fugitive dust generated during demolition and construction of the proposed development. There would be no construction related emissions resulting from the No Action Alternative.

6.1 Construction Schedule

Subject to FAA and Port Commission approval, construction would start in 2025 and would continue through 2032 for the Proposed Action and the Hybrid Terminal Option. The detailed construction phasing schedule for the Proposed Action and the Hybrid Terminal Option are provided in Attachment 6.

6.2 On-Road Construction Vehicles

Potential sources of construction emissions include construction vehicles and equipment. Potential on-road construction emissions were estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

- *Emission Rate (tons/year) for on-road vehicles = Emission Factor (grams/mile) x miles per day x # of days/year x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

Emission factors for on-road construction vehicles were developed using the MOVES4 model. For employee vehicle trips related to construction activities, the model was run using gasoline passenger vehicles including cars and light duty pickup trucks. For material delivery and off-site haul vehicle trips, diesel combination short-haul trucks were assumed as they are the most common type of vehicle for this service.

Total VMT for vehicles operating during each Proposed Action element and for each type of on-road construction activity during each construction year was estimated. This includes construction employee vehicle trips to and from the job site. The analysis also included material delivery trips and off-site hauling trips using heavy duty trucks. Potential on-road construction emissions were estimated by multiplying the VMT data by the appropriate emission factors and the necessary conversion factors to present the criteria air pollutant emissions in tons. The detailed assumptions for on-road construction vehicles and the emission factors for the Proposed Action and Hybrid Terminal Option are provided in Attachment 6 of this technical report.

6.3 Non-Road Construction Equipment

Potential non-road construction emissions were estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

- *Equipment Emission Rate (tons/year) = Full Throttle Emission Factor (grams/hp-hour) x size (hp) x hours per year x Load Factor x usage Factor x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

The construction phasing schedule and the dimensions of the Proposed Action elements including building dimension in square feet were obtained from the Port. Each proposed element was input into the ACEIT to estimate the type of construction equipment, horsepower, load factor, and operating hours for each project element and phase. The ACEIT was developed by the Airport Cooperative Research Program (ACRP) and the equipment and assumptions used in the program are drawn from ACRP

Report 102, Guidance for Estimating Airport Construction Emissions. The EPA's MOVES model was used to identify the emission factor of each criteria air pollutant for each equipment type. Non-road construction equipment emissions were calculated based on the number of operating hours of equipment use and the emission factors. The detailed assumptions of non-road construction equipment and the emission factors for the Proposed Action and Hybrid Terminal Option are provided in Attachment 6 of this technical report.

6.4 Proposed Action - Criteria Pollutant Construction Emissions Inventory

A summary of the construction emissions inventory with both on-road and non-road construction equipment for each year of construction of the Proposed Action is shown in **Table 6**. Peak construction emissions are expected to occur in 2028 for NO_x (40 tons) and 2029 for CO (239 tons). Fugitive dust from grading, moving soil, and digging, loading/unloading of trucks, movement of trucks on unpaved surfaces, and wind erosion of stockpiles is included in PM_{10} and $PM_{2.5}$ totals.

TABLE 6: ANNUAL CONSTRUCTION EMISSIONS INVENTORY - PROPOSED ACTION

Year	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2025	17	1	8	0	8	1
2026	124	3	24	0	8	2
2027	204	4	36	0	9	2
2028	214	5	40	0	9	2
2029	239	5	36	0	9	2
2030	181	3	24	0	8	2
2031	143	2	18	0	8	1
2032	40	1	9	0	8	1

Note: CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

6.5 Hybrid Option - Criteria Pollutant Construction Emissions Inventory

A summary of the construction emissions inventory for the Hybrid Terminal Option is shown in **Table 7**. Like the Proposed Action, peak construction emissions are expected to occur in 2028 for NO_x (47 tons) and 2029 for CO (242 tons), and would be equal to or slightly greater than the Proposed Action due to changes to the phasing schedule and the additional elements that must be constructed such as the proposed connection to Concourse D.

TABLE 7: ANNUAL CONSTRUCTION EMISSIONS INVENTORY - HYBRID TERMINAL OPTION

Year	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2025	17	1	8	0	8	1
2026	124	3	24	0	8	2
2027	201	5	39	0	9	2
2028	211	5	47	0	10	3
2029	242	5	44	0	9	3
2030	188	4	37	0	9	2
2031	149	3	31	0	9	2
2032	42	1	15	0	8	1

Note: Minor differences from the Proposed Action may not be evident due to rounding and the number of significant digits displayed. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

7. Future (2032) No Action Alternative

7.1 Aircraft

7.1.1 Aircraft Fleet Mix and Activity Levels

Based on the aircraft activity forecast, there would be an increase in operations from the Existing (2022) Condition to the Future (2032) No Action Alternative. The No Action Alternative would include none of the federal actions and no additional physical improvements to the Airport that are included in the Proposed Action, but includes projects that have recently been constructed, or will be constructed by 2032.[28] Even with no facility improvements there would be a total of 466,900 aircraft operations forecast for the Future (2032) No Action Alternative. This would be 65,549 annual operations more than the Existing (2022) Condition. Table 1-2 in Attachment 1 presents the average annual operations for specific aircraft types with the AEDT engine code modeled in AEDT for the Future (2032) No Action Alternative.

7.1.2 Aircraft Taxi Time

The airfield configuration (the layout of the runways and taxiways) identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative. The average taxi in and taxi out time for the Future (2032) No Action Alternative was determined by using the delay analysis developed with the Total Airspace and Airport Modeler (TAAM) tool normalized to the ASPM data.[29,30] The average taxi in time was nine minutes and 26 seconds and the average taxi out time was 21 minutes and 28 seconds for the Future (2032) No Action Alternative, for a total of 30 minutes and 54 seconds. These taxi in and taxi out times were applied to each operation in AEDT to develop the emissions inventory. The overall average taxi time increased one minute and 44 seconds for the Future (2032) No Action Alternative as compared to the Existing (2022) Condition. A summary of the taxi times for each scenario is provided in Table 1-6 in Attachment 1.

---

28 These future actions were established in August 2023 and include the North Satellite Redevelopment program, International Arrivals Facility, Terminal Renovations, C Concourse Expansion, A Concourse Building Expansion, Widen Arrivals Drive project, and Runway Renumbering. These projects are independent from the Proposed Action in this EA and have received or will receive separate environmental review and approval. These future actions are included in both, the future No Action and Proposed Action scenarios.

29 Leigh Fisher. Environmental Review Airside Modeling, June 2020.

30 Kandice Krull, FAA, Email to Sarah Potter, L&B, RE: SAMP NTP Env Review Normalized Taxi Times, July 10, 2023.

7.1.3 APUs

The APU durations per aircraft type identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative. As previously discussed, regional and narrow body aircraft were considered Code C aircraft and assigned a total APU duration of 22 minutes per operation and wide body aircraft were considered Code D or above and assigned a total APU duration of 32 minutes per operation. The AEDT database was used to assign the specific types of APU equipment used for each aircraft type. General Aviation operations were assigned the AEDT default APU equipment and usage per operation because data on specific general aviation equipment and usage were not available. The Future (2032) No Action Alternative would have greater APU usage as compared to the Existing (2022) Condition because of the increase in overall aircraft operations. See Table 2-2 in Attachment 2 for the estimated annual APU usage for the Future (2032) No Action Alternative.

7.1.4 Aircraft Run-Ups

The increase in overall aircraft operations in the Future (2032) No Action Alternative from the Existing (2022) Condition is anticipated to result in an increase the number of run-ups. Therefore, the number of aircraft run-ups was increased proportional to the forecast increase in aircraft operations. This resulted in a total of 555 run-up operations estimated for the Future (2032) No Action Alternative. This is an increase of 78 additional aircraft engine run-up operations over the Existing (2022) Condition.

7.2 Ground Support Equipment

7.2.1 Tenant-Owned GSE

The analysis assumed that tenant-owned GSE usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used.[31] Therefore, the type of tenant-owned GSE identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative. As such, no new pieces of equipment were added for the analysis; it was estimated that there would only be an increase in usage in those same pieces of equipment. Table 3-3 in Attachment 3 provides the tenant-owned GSE and estimated hours of annual usage for the Future (2032) No Action Alternative.

7.2.2 Port-Owned Airfield Vehicles and Equipment

The analysis assumed that Port-owned airfield vehicles and equipment usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used.[32] Therefore, the type of Port-owned airfield vehicles and equipment identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative. This means no new pieces of Port-owned airfield vehicles and equipment were added for the analysis; it was estimated that there would only be an increase in usage in those same pieces of equipment. This includes Port vehicles and equipment used for airfield maintenance purposes and to support hardstand operations at the Airport. Table 3-4 in Attachment 3 provides the Port-owned airfield vehicles and equipment and estimated annual usage for the Future (2032) No Action Alternative.

---

31 No future assumptions could be made on potential new equipment purchased by tenants operating at the Airport. While these tenants would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no known existing agreements or contracts for the purchase of any future equipment.

32 No future assumptions could be made on potential new equipment purchased by the Port. While the Port would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no existing agreements or contracts for the purchase of any future Port equipment.

7.3 Stationary Sources

7.3.1 Natural Gas Boilers and Heaters

The Future (2032) No Action Alternative would have additional natural gas boiler and heater usage for the Terminal Renovation, A Concourse Building Expansion, and C Concourse Expansion. Table 4-3 in Attachment 4 provides the location, equipment type, and usage of the natural gas boilers and heaters used for the Future (2032) No Action Alternative. It is assumed that there would be no other changes to the existing facilities or natural gas usage with the Future (2032) No Action Alternative. While there would be more passengers in the terminal facilities as compared to the Existing (2022) Condition, it was assumed there would be no change to the natural gas usage because natural gas usage is based on the area of the facility, not the number of passengers.

7.3.2 Diesel Generators

The Port would continue to conduct routine testing to make sure the generators are performing as they should and would be available if needed. The Future (2032) No Action Alternative would have additional diesel generators for the Terminal Renovation, A Concourse Building Expansion, and C Concourse Expansion that were not included in the Existing (2022) Condition. The location, name, horsepower, and annual usage of diesel-powered generators identified for the Future (2032) No Action Alternative are provided in Table 4-4 in Attachment 4. Table 4-7 in Attachment 4 provides a summary comparison of the diesel generator usage under the various alternatives.

7.3.3 Fuel Farm Tanks

There would be no change to the number or type of fuel tanks in the fuel farm with the Future (2032) No Action Alternative relative to the Existing (2022) Condition. The total volume of aviation fuel (Jet A) would be stored among eight existing fuel tanks located at the Airport's fuel farm. Therefore, the only change from the baseline conditions would be the potential increase in Jet A fuel use throughput based on the forecast increase in aircraft operations. It is estimated that the total volume of aviation fuel (Jet A) that would be supplied to aircraft would be 692,985,758 gallons for the Future (2032) No Action Alternative.

7.4 Motor Vehicles

7.4.1 Motor Vehicles (On- and Off-Airport Roadways)

The roadway segment identifier, segment length, vehicle classification, vehicle distribution, and speed for each roadway segment identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative. Traffic volumes would be anticipated to change as would the emission factors, as described in the following sections.

7.4.1.1 Traffic Volumes

Surface traffic levels would be expected to increase in the future with the Future (2032) No Action Alternative as compared to the Existing (2022) Condition. Traffic volumes were provided by the Port for this scenario to account for employee and cargo growth. Roadways for which only WSDOT data was available, traffic volumes were increased proportional to the forecast increase in passengers. The traffic volume on each roadway segment and the annual VMT per roadway segment are provided in Table 5-3 in Attachment 5. For the Future (2032) No Action Alternative there are anticipated to be 1,218,311,481 annual VMTs, an increase of 213,594,025 as compared to the Existing (2022) Condition.

7.4.1.2 Emissions Factors

The EPA's MOVES4 was used to generate emissions rates in grams of pollutant per vehicle mile traveled (g/VMT). The emission factors are unique to the year 2032 and King County and are different for each criteria pollutant, speed, and vehicle type. The emission factors for each pollutant by speed and vehicle type for the Future (2032) No Action Alternative are provided in Table 5-4 in Attachment 5. Emission factors for the Future (2032) No Action Alternative are lower as compared to the Existing (2022) Condition emissions factors. This is because EPA assumes in MOVES that older vehicles are gradually replaced by newer vehicles.[33] Newer vehicles would have lower emission rates according to newer emission standards as compared to older vehicles. Therefore, while there are more vehicles on- and off-roadways traveling more miles in the future, because the emission factors are lower, total emissions for motor vehicles would be less as compared to the Existing (2022) Condition.

7.4.2 Motor Vehicles (Parking Facilities)

The parking lots identified for the Existing (2022) Condition would remain the same for the Future (2032) No Action Alternative meaning there would be no new lots, change in vehicle speed or distance, or any increase in the number of parking stalls in the lots. The potential volume increase in motor vehicles using the Doug Fox Lot and the Terminal Parking Lot for the Future (2032) No Action Alternative was based on the forecast increase in passengers. The number of motor vehicles in those parking lots would increase commensurate with the increase in passengers. The potential volume increase in motor vehicles using the North Employee Parking Lot for the Future (2032) No Action Alternative was based on the forecast increase in aircraft operations. It was assumed that as aircraft operations increase so would the number of employees. Therefore, the number of motor vehicles estimated for the Future (2032) No Action Alternative in the North Employee Parking Lot was increased proportional to the forecast increase in aircraft operations.

7.5 Future (2032) No Action Alternative Criteria Pollutant Emissions Inventory

The criteria pollutant emissions inventory provides the total annual pollutant emissions as short tons per year. The emissions inventory for the Future (2032) No Action Alternative is shown in **Table 8**. The Future (2032) No Action Alternative emissions inventory shows the pollutants with the greatest emissions are CO and NOx. There were approximately 4,447 tons of CO and 2,923 tons of NO_x potentially emitted for the Future (2032) No Action Alternative. Aircraft produce the greatest contribution to CO emissions (48.4 percent) and NO_x emissions (94.4 percent).

[33] For EPA's guidance on emission factors see the following technical reports, Exhaust Emission Rates for Heavy-Duty Onroad Vehicles in MOVES4 (EPA-420-R-23-027 dated August 2023 and Exhaust Emission Rates for Light-Duty Onroad Vehicles in MOVES4 (EPA-420-R-23-028 dated August 2023) available online at https://www.epa.gov/moves/moves-onroad-technical-reports.

TABLE 8: ANNUAL OPERATIONAL EMISSIONS INVENTORY - FUTURE (2032) NO ACTION ALTERNATIVE

Emission Source	CO (ST)	VOC (ST)	NOx (ST)	SOx (ST)	PM10 (ST)	PM2.5 (ST)

Note: Totals may not sum due to rounding. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

8. Future (2032) Proposed Action

8.1 Aircraft

8.1.1 Aircraft Fleet Mix and Activity Levels

A total of 475,655 aircraft operations were forecast for the Future (2032) Proposed Action. This would be 8,755 annual operations more than the Future (2032) No Action Alternative. Table 1-3 in Attachment 1 presents the average annual operations with the specific airframe and AEDT engine code used for emissions modeling in AEDT for the Future (2032) Proposed Action.

8.1.2 Aircraft Taxi Time

The Proposed Action includes improvements to the existing airfield, which would potentially change the aircraft taxi time. The average taxi in and taxi out time for the Future (2032) Proposed Action was determined by using the delay analysis developed with the TAAM tool normalized to the ASPM data.[34,35] The average taxi in time was nine minutes and 12 seconds and the average taxi out time was 21 minutes and 18 seconds for the Future (2032) Proposed Action, for a total of 30 minutes and 30 seconds. These taxi in and taxi out times were applied to each operation in AEDT to develop the emissions inventory. The overall average taxi time decreased 24 seconds for the Future (2032) Proposed Action as compared to the Future (2032) No Action Alternative. While the Proposed Action has more aircraft operations than the No Action Alternative, the proposed improvements would increase the Airport's ability to accommodate increased aircraft operations and passenger activity by enhancing the efficiency of the overall taxiway layout and adding aircraft gates and passenger

[34] Leigh Fisher. Environmental Review Airside Modeling, June 2020.
[35] Kandice Krull, FAA, Email to Sarah Potter, L&B, RE: SAMP NTP Env Review Normalized Taxi Times, July 10, 2023.

processing facilities, reducing congestion in the terminal area. These improvements would reduce congestion on the taxiways and at the terminal. A summary of the taxi times for each scenario is provided in Table 1-6 in Attachment 1.

8.1.3 APUs

The APU durations per aircraft type identified for the Existing (2022) Condition would remain the same for the Future (2032) Proposed Action. As previously discussed, regional and narrow body aircraft were considered Code C aircraft and assigned a total APU duration of 22 minutes per operation and wide body aircraft were considered Code D or above and assigned a total APU duration of 32 minutes per operation. The AEDT database was used to assign the specific types of APU equipment used for each aircraft type. General Aviation operations were assigned the AEDT default APU equipment and usage per operation because data on specific general aviation equipment and usage were not available. The Future (2032) Proposed Action would have greater APU usage as compared to the Future (2032) No Action Alternative because of the increase in overall aircraft operations. See Table 2-3 in Attachment 2 for the estimated annual APU usage for the Future (2032) Proposed Action.

8.1.4 Aircraft Run-Ups

The increase in overall aircraft operations in the Future (2032) Proposed Action from the Existing (2022) Condition is anticipated to result in an increase the number of run-ups. Therefore, the number of aircraft run-ups was increased proportional to the forecast increase in aircraft operations. Therefore, a total of 565 run-up operations are estimated for the Future (2032) Proposed Action. This is an increase of ten additional run-up operations over the Future (2032) No Action Alternative.

8.2 Ground Support Equipment

8.2.1 Tenant-Owned GSE

The analysis assumed that tenant-owned GSE usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used.[36] Therefore, the type of tenant-owned GSE identified for the Existing (2022) Condition would remain the same for the Future (2032) Proposed Action. As such, no new pieces of equipment were added for the analysis; it was estimated that there would only be an increase in usage in those same pieces of equipment. Table 3-5 in Attachment 3 provides the tenant-owned GSE and estimated hours of annual usage for the Future (2032) Proposed Action.

8.2.2 Port-Owned Airfield Vehicles and Equipment

The analysis assumed that Port-owned airfield vehicles and equipment usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used. [37] The annual usage was increased proportional to the forecasted increase in aircraft operations. This includes Port vehicles and equipment used for airfield maintenance purposes and to support hardstand operations at the Airport. Table 3-6 in Attachment 3 provides the Port-owned airfield vehicles and equipment and estimated annual usage for the Future (2032) Proposed Action.

---

[36] No future assumptions could be made on potential new equipment purchased by the tenants operating at the Airport. While these tenants would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no known existing agreements or contracts for the purchase of any future equipment.

[37] No future assumptions could be made on potential new equipment purchased by the Port. While the Port would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no existing agreements or contracts for the purchase of any future Port equipment.

8.3 Stationary Sources

8.3.1 Natural Gas Boilers and Heaters

In addition to the Future (2032) No Action Alternative natural gas boilers and heaters, the Future (2032) Proposed Action includes new facilities that would use potentially new natural gas boilers. Table 4-5 in Attachment 4 provides the location, equipment type, and estimated usage of only the potential new natural gas boilers and heaters used for the Future (2032) Proposed Action. The number of potential new natural gas boilers and heaters were based on the proposed new facilities and the usage was based on how the Port uses the current natural gas boilers and heaters. All proposed new facilities were assumed to require natural gas usage to provide heat. While the Port would attempt to purchase more energy-efficient equipment, there are no existing agreements, contracts, or new energy code legislation that would require the Port to purchase higher efficiency boilers in the future. Therefore, the existing type of boilers were assumed to operate in the proposed new facilities.

8.3.2 Diesel Generators

In addition to the location, description, horsepower, and estimated annual usage of diesel-powered generators identified for the Future (2032) No Action Alternative, the Future (2032) Proposed Action includes potential new facilities that would require the use of new diesel-powered generators for standby and emergency power. The number of potential new generators was based on the proposed new facilities and the usage was based on how the Port uses and tests the current generators. Table 4-6 in Attachment 4 provides the location, description, horsepower, and estimated annual usage of the new diesel-powered generators for the Future (2032) Proposed Action. Table 4-7 in Attachment 4 provides a summary comparison of diesel generator usage under the various alternatives.

8.3.3 Fuel Farm Tanks

The Future (2032) Proposed Action includes four new fuel farm tanks to be able to meet future fuel demands. The potential increase in Jet A fuel throughput for the Future (2032) Proposed Action was based on the forecast increase in aircraft operations and the additional tanks. It is estimated that the total volume of aviation fuel (Jet A) that would be supplied to aircraft would be 705,980,168 gallons for the Future (2032) Proposed Action. This is 12,994,411 gallons of Jet A fuel throughput more than the Future (2032) No Action Alternative. The total volume of aviation fuel (Jet A) would be stored among 12 total fuel tanks, including eight existing fuel tanks and four new fuel tanks to be located at the Airport's fuel farm as part of the Proposed Action.

8.4 Motor Vehicles

8.4.1 Motor Vehicles (On- and Off-Airport Roadways)

The vehicle classifications and vehicle distribution identified for the Future (2032) No Action Alternative would remain the same for the Future (2032) Proposed Action. The emission factors identified for the Future (2032) No Action Alternative would also remain the same for the Future (2032) Proposed Action as emission factors are a function of year/age of the vehicle and vehicle classification. Roadway segments and traffic volumes would be anticipated to change due to the Proposed Action, as described in the following sections.

8.4.1.1 Roadway Segments

The Proposed Action would result in elimination of several existing roadway segments and construction and operation of several new roadways to accommodate the new proposed facilities. The roadway segments that were eliminated and constructed are identified in Table 5-5 in Attachment 5. The roadway segments identified for the Proposed Action are provided in Exhibits 5-12 through 5-22 in Attachment 5.

8.4.1.2 Traffic Volumes

Traffic volumes were provided by the Port for this scenario to account for employee and cargo growth. Roadways for which only WSDOT data was available, traffic volumes were increased proportionally to the forecast increase in passengers. The traffic volume on each roadway segment and the annual VMT per roadway segment are provided in Table 5-5 in Attachment 5. For the Future (2032) Proposed Action there are anticipated to be 1,247,969,250 annual VMTs, an increase of 29,657,769 annual VMTs as compared to the Future (2032) No Action Alternative.

8.4.2 Motor Vehicles (Parking Facilities)

Emissions are based on volumes of vehicles in the parking facilities, distance traveled within the parking facility, and speed of vehicles. The potential volume increase in passenger traffic in the terminal parking lot for the Future (2032) Proposed Action was based on the forecasted increase in passengers. The total forecast of passengers was used to represent the potential increase in traffic volumes. The potential volume increase in motor vehicles using the North Employee Parking Lot for the Future (2032) Proposed Action was based on the forecast increase in aircraft operations. It was assumed that as aircraft operations increase, and new facilities are constructed, the number of employees would also grow. Therefore, the number of motor vehicles estimated for the Future (2032) Proposed Action in the North Employee Parking Lot was increased proportional to the forecast increase in aircraft operations. There would be no change in vehicle speed or distance in these parking lots from the Future (2032) No Action Alternative.

The Proposed Action includes the removal of the Doug Fox Lot and the addition of new parking lots. For the new employee parking structure (L07), new north holding lot (L05), and the new terminal parking structure (T02), volumes were estimated by assuming the lots would operate at full capacity, meaning it was estimated there would be vehicles in all of the stalls.[38] Distance for a vehicle to travel was based on the length from the first parking stall from the entrance to the last stall using every aisle and floor if applicable. It was calculated that the average distance traveled for vehicles in the new employee parking structure (L07) was 0.38 miles, the average distance traveled by vehicles in the new north holding lot (L05) was 0.42 miles, and the average distance traveled by vehicles in the new terminal parking structure (T02) was 0.48 miles. In order to determine emissions, an average speed of five (5) mph was assumed for vehicles in these new parking lots.

[38] A daily turnover rate of 2.5 was applied on the terminal parking and daily turnover rate of 3 was applied to the employee parking based on professional judgment.

8.5 Future (2032) Proposed Action Criteria Pollutant Emissions Inventory

The criteria pollutant emissions inventory provides the total annual pollutant emissions as short tons per year. The emissions inventory for the Future (2032) Proposed Action is shown in **Table 9**. The Future (2032) Proposed Action emissions inventory shows the pollutants with the greatest emissions are CO and NOx. There were approximately 4,517 tons of CO and 2,984 tons of NO_x potentially emitted for the Future (2032) Proposed Action. Aircraft produce the greatest contribution to CO emissions (48.7 percent) and NO_x emissions (96 percent). A summary comparison of the Future (2032) No Action Alternative and the Future (2032) Proposed Action is provided in Section 10.1 of this technical report.

TABLE 9: ANNUAL OPERATIONAL EMISSIONS INVENTORY - FUTURE (2032) PROPOSED ACTION

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
Aircraft	**2,166**	**251**	**2,807**	**239**	**28**	**28**
LTO (includes Start-Up, Approach, Climb, and Taxiing)	2,054	235	2,675	225	14	14
APUs	111	16	74	11	13	13
Aircraft Run-Ups	1	0	58	2	0	0
GSE	**194**	**6**	**14**	**0**	**1**	**1**
Tenant-Owned GSE	191	6	9	0	1	0
Port-Owned Airfield Vehicles and Equipment	3	0	4	0	0	0
Stationary Sources	**23**	**15**	**39**	**54**	**1**	**1**
Natural Gas Boilers and Heaters	19	1	23	0	0	0
Diesel Generators	4	0	16	54	0	0
Fuel Farm Tanks	0	13	0	0	0	0
Motor Vehicles	**2,135**	**18**	**124**	**2**	**4**	**3**
Parking Facilities	39	1	3	0	0	0
On and Off-Airport Roadways (includes Airside Deliveries)	2,096	17	121	2	4	3
Total	**4,517**	**290**	**2,984**	**295**	**33**	**33**

Note: Totals may not sum due to rounding. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

9. Future (2032) Hybrid Option

The Future (2032) Hybrid Terminal Option would have the same operational impacts as the Future (2032) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same. Therefore, the criteria pollutant emissions inventory for the Future (2032) Hybrid Terminal Option would be the same as the Future (2032) Proposed Action.

10. Comparison of 2032 Alternatives

The results of the emission inventories prepared for the Future (2032) Proposed Action and the Future (2032) Hybrid Terminal Option were compared to the results of the emission inventories prepared for the Future (2032) No Action Alternative to disclose the potential increase in emissions.

10.1 Future (2032) Proposed Action

The results of the comparison between the Future (2032) Proposed Action and the Future (2032) No Action Alternative are shown in **Table 10**.

TABLE 10: SUMMARY OF ANNUAL CRITERIA POLLUTANT EMISSIONS, PROPOSED ACTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2032

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2032 No Action Alternative	4,447	283	2,923	275	32	32
2032 Proposed Action	4,557	291	2,993	295	41	34
Construction	*40*	*1*	*9*	*0*	*8*	*1*
Operational	*4,517*	*290*	*2,984*	*295*	*33*	*33*
2032 Increase in Emissions	**110**	**8**	**70**	**20**	**9**	**2**

Note: Totals may not sum due to rounding. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter.
Source: Port of Seattle and L&B, 2024.

Emissions of all pollutants are expected to be greater with the Future (2032) Proposed Action than the Future (2032) No Action Alternative, mainly due to the higher level of airport activity that the Future (2032) Proposed Action would serve. Overall, there are more aircraft operations forecast with the Proposed Action as compared to the No Action Alternative in future years. Implementation of the NTPs would increase the Airport's ability to accommodate increased aircraft operations and passenger activity by adding aircraft gates and passenger processing facilities. Annual aircraft operations for the Future (2032) Proposed Action are forecast to increase to 475,655 aircraft operations. The Future (2032) Proposed Action would serve 8,755 more operations (1.9 percent) than the Future (2032) No Action Alternative, which would result in a potential increase in emissions. While operational efficiencies would be achieved with the Proposed Action, emissions would be greater due to the higher level of operations.

10.2 Future (2032) Hybrid Option

The results of the comparison between the Future (2032) Hybrid Terminal Option and the Future (2032) No Action Alternative are shown in **Table 11**.

TABLE 11: SUMMARY OF ANNUAL CRITERIA POLLUTANT EMISSIONS, HYBRID TERMINAL OPTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2032

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2032 No Action Alternative	4,447	283	2,923	275	32	32
2032 Hybrid Terminal Option	4,559	291	2,999	295	41	34
Construction	42	1	15	0	8	1
Operational	4,517	290	2,984	295	33	33
2032 Increase in Emissions	**112**	**8**	**76**	**20**	**9**	**2**

Note: Totals may not sum due to rounding. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

The Future (2032) Hybrid Terminal Option would have the same operational impacts as the Future (2032) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same. Minor differences in construction activities for Future (2032) Hybrid Terminal Option would result in the Future (2032) Hybrid Terminal Option having slightly greater overall emissions as compared to those for the Future (2032) Proposed Action.

11. Future (2037) No Action Alternative

11.1 Aircraft

11.1.1 Aircraft Fleet Mix and Activity Levels

Based on the aircraft activity forecast, there would be an increase in operations from the Future (2032) No Action Alternative to the Future (2037) No Action Alternative. There would be a total of 474,874 aircraft operations forecast for the Future (2037) No Action Alternative. Table 1-4 in Attachment 1 presents the average annual operations with the specific airframe type and AEDT engine code used for AEDT modeling for the Future (2037) No Action Alternative.

11.1.2 Aircraft Taxi Time

The airfield configuration (runway layout and taxiways) identified for the Future (2032) Condition would remain the same for the Future (2037) No Action Alternative. The average taxi in and taxi out time for the Future (2037) No Action Alternative was determined by using the delay analysis developed with the TAAM tool normalized to the ASPM data.[39,40] The average taxi in time was nine minutes and 41 seconds and the average taxi out time was 21 minutes and 42 seconds for the Future (2037) No Action Alternative for a total of 31 minutes and 23 seconds. These taxi in and taxi out times were applied to each operation in AEDT to develop the emissions inventory. The additional aircraft created additional taxi time on the taxiways. A summary of the taxi times for each scenario is provided in Table 1-6 in Attachment 1.

[39] Leigh Fisher. Environmental Review Airside Modeling, June 2020.
[40] Kandice Krull, FAA, Email to Sarah Potter, L&B, RE: SAMP NTP Env Review Normalized Taxi Times, July 10, 2023.

11.1.3 APUs

The APU durations per aircraft type identified for the Future (2032) No Action Alternative would remain the same for the Future (2037) No Action Alternative. As previously discussed, regional and narrow body aircraft were considered Code C aircraft and assigned a total APU duration of 22 minutes per operation and wide body aircraft were considered Code D or above and assigned a total APU duration of 32 minutes per operation. The AEDT database was used to assign the specific types of APU equipment used for each aircraft type. General Aviation operations were assigned the AEDT default APU equipment and usage per operation because data on specific general aviation equipment and usage were not available. The Future (2037) No Action Alternative would have greater APU usage as compared to the Future (2032) No Action Alternative because of the increase in overall aircraft operations. See Table 2-4 in Attachment 2 for the estimated annual APU usage for the Future (2037) No Action Alternative.

11.1.4 Aircraft Run-Ups

The number of aircraft run-ups was increased proportional to the forecast increase in aircraft operations. Therefore, a total of 564 run-up operations are estimated for the Future (2037) No Action Alternative.

11.2 Ground Support Equipment

11.2.1 Tenant-Owned GSE

The analysis assumed that tenant-owned GSE usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used.[41] Therefore, the type of tenant-owned GSE identified for the Existing (2022) Condition would remain the same for the Future (2037) No Action Alternative. As such, no new pieces of equipment were added for the analysis; it was estimated that there would only be an increase in usage in those same pieces of equipment. Table 3-7 in Attachment 3 provides the tenant-owned GSE and estimated hours of annual usage modeled for the Future (2037) No Action Alternative.

11.2.2 Port-Owned Airfield Vehicles and Equipment

The type of Port-owned airfield vehicles and equipment identified for the Future (2037) No Action Alternative would remain the same as for the Future (2032) No Action Alternative. As with the Future (2032) No Action Alternative, the analysis assumed that Port-owned airfield vehicles and equipment usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used. [42] The annual usage was increased proportional to the forecast increase in aircraft operations. This includes Port vehicles and equipment used for airfield maintenance purposes and to support hardstand operations at the Airport. Table 3-8 in Attachment 3 provides the Port-owned airfield vehicles and equipment and estimated annual usage for the Future (2037) No Action Alternative.

---

41 No future assumptions could be made on potential new equipment purchased by the tenants operating at the Airport. While these tenants would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no known existing agreements or contracts for the purchase of any future equipment.

42 No future assumptions could be made on potential new equipment purchased by the Port. While the Port would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no existing agreements or contracts for the purchase of any future Port equipment.

11.3 Stationary Sources

11.3.1 Natural Gas Boilers and Heaters

The location, equipment type, and usage of natural gas boilers and heaters identified for the Future (2032) No Action Alternative would remain the same for the Future (2037) No Action Alternative.

11.3.2 Diesel Generators

The location, name, horsepower, and annual usage of diesel-powered generators identified for the Future (2032) No Action Alternative would remain the same for the Future (2037) No Action Alternative.

11.3.3 Fuel Farm Tanks

The potential increase in Jet A fuel throughput for the Future (2037) No Action Alternative was based on the forecast increase in aircraft operations. It is estimated that the total volume of aviation fuel (Jet A) that would be supplied to aircraft would be 704,820,987 gallons for the Future (2037) No Action Alternative. The total volume of aviation fuel (Jet A) would be stored among eight existing fuel tanks located at the Airport's fuel farm.

11.4 Motor Vehicles

11.4.1 Motor Vehicles (On- and Off-Airport Roadways)

The roadway segment identifier, segment length, vehicle classification, vehicle distribution, and speed for each roadway segment identified for the Future (2032) No Action Alternative would remain the same for the Future (2037) No Action Alternative. Traffic volumes would be anticipated to change as would the emission factors, as described in the following sections.

11.4.1.1 Traffic Volumes

The forecasted traffic volume on each roadway segment and the annual VMT per roadway segment are provided in Table 5-6 in Attachment 5. The table notes the length of the segment and the average daily traffic, which is then multiplied by 365 to provide an annual total. Traffic volumes were provided by the Port for this scenario to account for employee and cargo growth. Roadways for which only WSDOT data was available, traffic volumes were increased proportional to the forecast increase in passengers. For the Future (2037) No Action Alternative there are anticipated to be 1,295,066,721 annual VMTs.

11.4.1.2 Emissions Factors

The EPA's MOVES4 was used to generate emissions rates in grams of pollutant per vehicle mile traveled (g/VMT). The emission factors are unique to the year 2037 and King County and are different for each criteria pollutant, speed, and vehicle type. The emission factors for each pollutant by speed and vehicle type for the Future (2037) No Action Alternative are provided in Table 5-7 in Attachment 5. Emission factors for the Future (2037) No Action Alternative are lower as compared to the Existing (2022) Condition and the Future (2032) No Action Alternative emissions factors. As previously stated, EPA assumes in MOVES that older vehicles are gradually replaced by newer vehicles.[43] Therefore, while there are more vehicles on- and off-roadways traveling more miles in the future, because the

[43] For EPA's guidance on emission factors see the following technical reports, Exhaust Emission Rates for Heavy-Duty Onroad Vehicles in MOVES4 (EPA-420-R-23-027 dated August 2023 and Exhaust Emission Rates for Light-Duty Onroad Vehicles in MOVES4 (EPA-420-R-23-028 dated August 2023) available online at https://www.epa.gov/moves/moves-onroad-technical-reports.

emission factors are lower, total emissions for motor vehicles for the Future (2037) No Action Alternative would be less as compared to the Future (2032) No Action Alternative.

11.4.2 Motor Vehicles (Parking Facilities)

The parking lots identified for the Future (2032) No Action Alternative would remain the same for the Future (2037) No Action Alternative meaning there would be no new lots, change in vehicle speed or distance within the lots, or any increase in the number of parking stalls in the lots. The potential volume increase in motor vehicles using the Doug Fox Lot and the Terminal Parking Lot for the Future (2037) No Action Alternative was based on the forecast increase in total passengers. The number of motor vehicles in those parking lots would increase commensurate with the increase in total passengers. The potential volume increase in motor vehicles using the North Employee Parking Lot for the Future (2037) No Action Alternative was based on the forecast increase in aircraft operations. It was assumed that as aircraft operations increase so would the number of employees. Therefore, the number of motor vehicles estimated for the Future (2037) No Action Alternative in the North Employee Parking Lot was increased proportional to the forecast increase in aircraft operations.

11.5 Future (2037) No Action Alternative Criteria Pollutant Emissions Inventory

The criteria pollutant emissions inventory provides the total annual pollutant emissions as short tons per year. The emissions inventory for the Future (2037) No Action Alternative is shown in **Table 12**. The Future (2037) No Action Alternative emissions inventory shows the pollutants with the greatest emissions are CO and NOx. There were approximately 3,982 tons of CO and 3,088 tons of NO_x potentially emitted for the Future (2037) No Action Alternative. Aircraft produce the greatest contribution to CO emissions (52.5 percent) and NO_x emissions (96.3 percent).

TABLE 12: ANNUAL OPERATIONAL EMISSIONS INVENTORY - FUTURE (2037) NO ACTION ALTERNATIVE

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
Aircraft	**2,089**	**238**	**2,975**	**242**	**29**	**29**
LTO (includes Start-Up, Approach, Climb, and Taxiing)	1,972	222	2,842	227	13	13
APUs	117	16	77	12	15	15
Aircraft Run-Ups	1	0	56	2	0	0
GSE	**194**	**6**	**13**	**0**	**1**	**1**
Tenant-Owned GSE	191	6	9	0	0	0
Port-Owned Airfield Vehicles and Equipment	3	0	4	0	0	0
Stationary Sources	**16**	**11**	**27**	**37**	**1**	**1**
Natural Gas Boilers and Heaters	13	1	16	0	0	0
Diesel Generators	2	0	11	37	0	0
Fuel Farm Tanks	0	10	0	0	0	0
Motor Vehicles	**1,682**	**14**	**72**	**2**	**2**	**2**
Parking Facilities	27	1	2	0	0	0
On and Off-Airport Roadways (includes Airside Deliveries)	1,655	13	71	2	2	2
Total	**3,982**	**268**	**3,088**	**281**	**32**	**32**

Note: Totals may not sum due to rounding. CO = carbon monoxide, VOC = Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x = sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

12. Future (2037) Proposed Action

12.1 Aircraft

12.1.1 Aircraft Fleet Mix and Activity Levels

There would be a total of 509,892 aircraft operations forecast for the Future (2037) Proposed Action. This would be an increase of 35,018 annual operations more than the Future (2037) No Action Alternative. Table 1-5 in Attachment 1 presents the average annual operations for the specific airframe type with the AEDT engine code modeled in AEDT for the Future (2037) Proposed Action.

12.1.2 Aircraft Taxi Time

The same airfield configuration used for the Future (2032) Proposed Action was used for the Future (2037) Proposed Action. The average taxi in and taxi out time for the Future (2037) Proposed Action was determined by using the delay analysis developed with the TAAM tool normalized to the ASPM data.[44,45] The average taxi in time was nine minutes and 45 seconds and the average taxi out time was 23 minutes and 32 seconds for the Future (2037) Proposed Action, for a total of 33 minutes and 17 seconds. These taxi in and taxi out times were applied to each operation in AEDT to develop the emissions inventory. The overall average taxi time increased one minute and 54 seconds for the Future (2037) Proposed Action as compared to the Future (2037) No Action Alternative. While the Proposed Action includes proposed facility improvements which would increase the Airport's ability to accommodate an increase in operations in 2037, airfield constraints would result in the Airport still experiencing increases in taxi times due to the higher number of total aircraft operating on the runways and taxiways, as well as the location of the proposed gates in relationship to the end of the runways. A summary of the taxi times for each scenario is provided in Table 1-6 in Attachment 1.

12.1.3 APUs

The APU durations per aircraft type identified for the Future (2037) No Action Alternative would remain the same for the Future (2037) Proposed Action. As previously discussed, regional and narrow body aircraft were considered Code C aircraft and assigned a total APU duration of 22 minutes per operation and wide body aircraft were considered Code D or above and assigned a total APU duration of 32 minutes per operation. The AEDT database was used to assign the specific types of APU equipment used for each aircraft type. General Aviation operations were assigned the AEDT default APU equipment and usage per operation because data on specific general aviation equipment and usage were not available. The Future (2037) Proposed Action would have greater APU usage as compared to the Future (2037) No Action Alternative because of the increase in overall aircraft operations. See Table 2-5 in Attachment 2 for the estimated annual APU usage for the Future (2037) Proposed Action.

12.1.4 Aircraft Run-Ups

The increase in overall aircraft operations in the Future (2037) Proposed Action from the Future (2037) No Action Alternative is anticipated to result in an increase in the number of run-ups. The number of aircraft run-ups was increased proportional to the forecast increase in aircraft operations. Therefore, a total of 606 aircraft run-up operations are estimated for the Future (2037) Proposed Action. This is an increase of 42 additional run-up operations over the Future (2037) No Action Alternative.

---

44 Leigh Fisher. Environmental Review Airside Modeling, June 2020.
45 Kandice Krull, FAA, Email to Sarah Potter, L&B, RE: SAMP NTP Env Review Normalized Taxi Times, July 10, 2023.

12.2 Ground Support Equipment

12.2.1 Tenant-Owned GSE

The analysis assumed that tenant-owned GSE usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used.[46] Therefore, the type of tenant-owned GSE identified for the Existing (2022) Condition would remain the same for the Future (2037) Proposed Action Alternative. As such, no new pieces of equipment were added for the analysis; it was estimated that there would only be an increase in usage in those same pieces of equipment. Table 3-9 in Attachment 3 provides the tenant-owned GSE and estimated hours of annual usage modeled for the Future (2037) Proposed Action.

12.2.2 Port-Owned Airfield Vehicles and Equipment

The analysis assumed that Port-owned airfield vehicles and equipment usage would increase commensurate with the forecast in aircraft activity and that the same types of vehicles would be used. [47] The annual usage was increased proportional to the forecasted increase in aircraft operations. This includes Port vehicles and equipment used for airfield maintenance purposes and to support hardstand operations at the Airport. Table 3-10 in Attachment 3 provides the Port-owned airfield vehicles and equipment and estimated annual usage for the Future (2037) Proposed Action.

12.3 Stationary Sources

12.3.1 Natural Gas Boilers and Heaters

The location, equipment type, and usage of natural gas boilers and heaters identified for the Future (2032) Proposed Action would remain the same for the Future (2037) Proposed Action. There would be no change in square footage of new facilities from 2032 to 2037 with the Proposed Action. While the total number of passengers would increase, natural gas usage is based on the area of the facility not the number of passengers.

12.3.2 Diesel Generators

The location, description, horsepower, and estimated annual usage of diesel-powered generators identified for the Future (2032) Proposed Action would remain the same for the Future (2037) Proposed Action.

12.3.3 Fuel Farm Tanks

The potential increase in Jet A fuel throughput for the Future (2037) Proposed Action was based on the forecast increase in aircraft operations. It is estimated that the total volume of aviation fuel (Jet A) that would be supplied to aircraft would be 756,795,661 gallons for the Future (2037) Proposed Action. This is an increase of 51,974,674 gallons of fuel throughput compared to the Future (2037) No Action Alternative. The total volume of aviation fuel (Jet A) would be stored among 12 fuel tanks, including eight existing fuel tanks and four new fuel tanks to be located at the Airport's fuel farm as part of the Proposed Action.

---

46 No future assumptions could be made on potential new equipment purchased by the tenants operating at the Airport. While these tenants would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no known existing agreements or contracts for the purchase of any future equipment.

47 No future assumptions could be made on potential new equipment purchased by the Port. While the Port would need to buy new equipment as older equipment reaches its end-of-life cycle, there are no existing agreements or contracts for the purchase of any future Port equipment.

12.4 Motor Vehicles

12.4.1 Motor Vehicles (On- and Off-Airport Roadways)

The roadway segment identifier, segment length, vehicle classification, vehicle distribution, and speed for each roadway segment identified for the Future (2032) Proposed Action would remain the same for the Future (2037) Proposed Action. The emission factors identified for the Future (2037) No Action Alternative would remain the same for the Future (2037) Proposed Action as emission factors are based upon the year/vehicle age and vehicle classification and would not be changed by the Proposed Action. Traffic volumes would be anticipated to change as described in the following section.

12.4.1.1 Traffic Volumes

The forecasted traffic volume on each roadway segment and the annual VMT per roadway segment are provided in Table 5-8 in Attachment 5. Traffic volumes were provided by the Port for this scenario to account for employee and cargo growth. Roadways for which only WSDOT data was available, traffic volumes were increased proportional to the forecast increase in passengers. For the Future (2037) Proposed Action there are anticipated to be 1,377,374,995 annual VMTs, an increase of 82,308,275 annual VMTs as compared to the Future (2037) No Action Alternative.

12.4.2 Motor Vehicles (Parking Facilities)

The parking lots identified for the Future (2032) Proposed Action would remain the same for the Future (2037) Proposed Action. The potential increase in passenger traffic in the parking lots for the Future (2037) Proposed Action was based on the forecast increase in passengers as parking lot use was increased in proportion to the change in passengers. The total forecast passengers were used to represent the potential increase in traffic volumes.

12.5 Future (2037) Proposed Action Criteria Pollutant Emissions Inventory

The criteria pollutant emissions inventory provides the total annual pollutant emissions as short tons per year. The emissions inventory for the Future (2037) Proposed Action is shown in **Table 13**. The Future (2037) Proposed Action emissions inventory shows the pollutants with the greatest emissions are CO and NOx. There were approximately 4,245 tons of CO and 3,314 tons of NO_x potentially emitted for the Future (2037) Proposed Action. Aircraft produce the greatest contribution to CO emissions (52.6 percent) and NO_x emissions (96.1 percent). A summary comparison of the Future (2037) No Action Alternative and the Future (2037) Proposed Action is provided in Section 14.1 of this technical report.

TABLE 13: ANNUAL OPERATIONAL EMISSIONS INVENTORY - FUTURE (2037) PROPOSED ACTION

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)

Parking Facilities	32	1	2	0	0	0
On and Off-Airport Roadways (includes Airside Deliveries)	1,752	14	74	2	2	2
Total	**4,245**	**288**	**3,314**	**315**	**35**	**34**

Note: Totals may not sum due to rounding. CO =carbon monoxide, VOC=Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x= sulfur oxides, PM_{10} = coarse particulate matter, $PM_{2.5}$ = fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

13. Future (2037) Hybrid Option

The Future (2037) Hybrid Terminal Option would have the same operational impacts as Future (2037) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same. Therefore, the criteria pollutant emissions inventory for the Future (2037) Hybrid Terminal Option would be the same as the Future (2037) Proposed Action.

14. Comparison of 2037 Alternatives

The results of the emission inventories prepared for the Future (2037) Proposed Action and the Future (2037) Hybrid Terminal Option were compared to the results of the emission inventories prepared for the Future (2037) No Action Alternative to disclose the potential increase in emissions.

14.1 Future (2037) Proposed Action

The results of the comparison between the Future (2037) Proposed Action and the Future (2037) No Action Alternative are shown in **Table 14**.

TABLE 14: SUMMARY OF ANNUAL CRITERIA POLLUTANT EMISSIONS, PROPOSED ACTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2037

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2037 No Action Alternative	3,982	268	3,088	281	32	32
2037 Proposed Action (Operational Only)	4,245	288	3,314	315	35	34
2037 Increase in Emissions	***263***	***20***	***225***	***34***	***3***	***2***

Note: Totals may not sum due to rounding. CO =carbon monoxide, VOC=Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x= sulfur oxides, PM_{10}=coarse particulate matter, $PM_{2.5}$= fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

Emissions of all pollutants are expected to be greater with the Proposed Action than the No Action Alternative, mainly due to the higher level of airport activity that the Proposed Action would serve. Implementation of the NTPs would increase the Airport's ability to accommodate increased aircraft operations and passenger activity by adding aircraft gates and passenger processing facilities. Annual aircraft operations for the Future Proposed Action are forecast to increase to 509,892 in 2037. The Proposed Action would serve 35,018 more operations in 2037 (7.4 percent) than the No Action Alternative, which would result in a potential increase in emissions. While operational efficiencies would be achieved with the Proposed Action, emissions would be greater due to the higher level of operations.

The largest change to emissions with the Proposed Action would occur in 2037 when the activity difference is the greatest relative to the No Action. CO emissions would increase from 3,982 tons (No Action) to 4,245 tons (Proposed Action) or 263 tons (a 6.6 percent change). VOC emissions in 2037 would be 7.3 percent higher with the Proposed Action, NO_x emissions would be 7.3 percent higher, SO_x emissions would be 12.3 percent higher, and PM_{10} and $PM_{2.5}$ emissions would be 7.8 percent higher due to the Proposed Action.[48]

14.2 Future (2037) Hybrid Option

The results of the comparison between the Hybrid Terminal Option and the No Action Alternative are shown in **Table 15**.

TABLE 15: SUMMARY OF ANNUAL CRITERIA POLLUTANT EMISSIONS, HYBRID TERMINAL OPTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2037

Emission Source	CO (ST)	VOC (ST)	NO_x (ST)	SO_x (ST)	PM_{10} (ST)	$PM_{2.5}$ (ST)
2037 No Action Alternative	3,982	268	3,088	281	32	32
2037 Hybrid Terminal Option (Operational Only)	4,245	288	3,314	315	35	34
2037 Increase in Emissions	**263**	**20**	**225**	**34**	**3**	**2**

Note: Totals may not sum due to rounding. CO =carbon monoxide, VOC=Volatile Organic Compounds, NO_x = nitrogen oxides, SO_x= sulfur oxides, PM_{10}=coarse particulate matter, $PM_{2.5}$= fine particulate matter, ST = short tons.
Source: Port of Seattle and L&B, 2024.

The Hybrid Terminal Option would have the same operational impacts as the Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands.

[48] The reported percent increases were estimated using derived results prior to rounding.

15. Air Quality Significance Determination

An emissions inventory is a summary in tons per year of the total pollutants generated by an alternative. Pollutant concentrations in the NAAQS are measured in micrograms per cubic meter or parts per million/billion and describe concentrations of the pollutants in the air. An emissions inventory is not directly comparable to the NAAQS.

Of the projected pollutant increases, the largest increase would be to CO and NOx. The Port worked with PSCAA in developing the region's most recent air quality plan and prior SIPs and has kept the region abreast of activity levels at the Airport as the region came into attainment. The Washington State Department of Ecology has established an air monitoring network around the state that measures air pollution. The air quality monitoring stations in King County are maintained by the PSCAA. The air quality monitoring stations closest to the Airport are Seattle South Park, Kent, Allentown, and Beacon Hill. CO levels have decreased significantly in the Puget Sound region primarily due to emissions controls on car engines. The most recent publicly available data on CO and NO_x from the air quality monitors indicate that not only the air quality complies with the NAAQS but concentrations are below the NAAQS for CO and NOx.[49] Therefore, the potential increase in criteria pollutant emissions, as shown in the emissions inventory for the Proposed Action or the Hybrid Terminal Option as compared to the No Action Alternative, would not be expected to create any new violation of the NAAQS.[50]

16. Federal Regulatory Setting for GHG

On January 9, 2023, Council on Environmental Quality (CEQ) issued the *National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change*, which is interim guidance to assist agencies in analyzing greenhouse gas and climate change effects of their proposed actions under NEPA. Per FAA Order 1050.1F Desk Reference, there are no federal significance thresholds for greenhouse gas (GHG) emissions, nor has the FAA identified specific factors to consider in making a significance determination for GHG emissions. After the publication of the Draft EA, Executive Order (EO) 13990, which was relied upon for the January 2023 CEQ draft GHG guidance, was revoked. In addition, CEQ revoked its regulations (40 CFR parts 1500-1508) implementing NEPA, 42 U.S.C. 4321 *et seq.,* as amended, in response to EO 14154. As a result of these changes, all references to climate and the qualitative climate evaluation that discussed the level of preparedness with respect to the impacts of climate change, the extent to which the alternatives could be affected by future climate conditions, and if the alternatives are consistent with national, state, and local climate goals has been removed from this Technical Report.

17. Overall Approach to GHG Assessment

Per FAA Order 1050.1F, the discussion of potential GHG emissions should be documented in a separate section of the NEPA document, distinct from air quality.[51] FAA guidance notes that if a project might increase criteria pollutants and/or fuel use, it could increase GHG emissions, warranting an emissions inventory.

---

49 Puget Sound Clean Air Agency. 2022 Air Quality Data Summary, December 2023.
50 Erik Saganić, PSCAA, Email to Kandice Krull, FAA, RE: Sea-Tac International Airport Preliminary Air Results, December 14, 2023.
51 FAA, April 2015, Order 1050.1F Paragraph 4-1. Climate is considered a separate section from Air Quality.

GHG emissions inventories were conducted to provide the estimate of the annual rate (metric tons per year) of GHG emissions attributable to airport sources for the No Action Alternative and the Proposed Action. The GHG emissions inventories were conducted in accordance with the guidelines provided in FAA Order 1050.1F, *Environmental Impacts: Policies and Procedures (including the Desk Reference);* FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*; FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1;* and the CEQ's *National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change.* Per these guidelines, the GHG assessment was developed to include a NEPA GHG emissions inventory and disclosure of estimated GHG emissions as detailed below.

18. GHG Methodology

18.1 Pollutants

GHGs are gases that trap heat in the earth's atmosphere. GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFC), and perfluorocarbons (PFCs). Of these GHGs, only CO_2, CH_4 and N_2O are potentially emitted directly or indirectly as a consequence of the Proposed Action and are included in this analysis.[52]

18.2 Global Warming Potential

GHGs differ from each other in their ability to absorb energy and how long they stay in the atmosphere. The Global Warming Potential (GWP) was developed to allow comparisons of global warming impacts of different gases by converting each gas amount to a carbon dioxide equivalent (CO_2e).[53] GWPs provide a common unit of measure, which allows for one emission estimate of these different gases.

For this analysis, GWPs were based on a 100-year period (GWP 100) provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1* and based on the Intergovernmental Panel on Climate Change (IPCC), Fifth Assessment Report (AR5).[54] CO_2 has a GWP of one (1) because it is the gas used as the reference point. Methane does not last as long in the atmosphere as CO_2 however it absorbs much more energy. Therefore, one ton of methane has 34 times more heat capturing potential than one ton of carbon dioxide. The amount of methane emissions would be multiplied by 34 to determine its CO_2e value. Nitrous oxides last in the atmosphere far longer than CO_2. The amount of nitrous oxides emissions would be multiplied by 298 to determine its CO_2e value.

---

52 Per EPA, fluorinated gases are generally emitted as refrigerants and through industrial processes such as aluminum and semiconductor manufacturing. Additional information from the EPA on fluorinated gases can be found at https://www.epa.gov/ghgemissions/overview-greenhouse-gases

53 EPA, 2017, Understanding Global Warming Potentials. https://www.epa.gov/ghgemissions/understanding-global-warming-potentials, Accessed August 2017.

54 There are also 20-year GWP values which prioritizes gases with shorter lifetimes. For example, the GWP 20 value for methane is 86, according to IPCC AR5, as compared to the GWP 100 value of 34. There is no difference between GWP 100 and GWP 20 for CO_2 and only a minor difference for nitrous oxides (GWP 100 is 298 and GWP 20 is 268). It is acknowledged that GHG emissions, especially for methane, would be higher using the GWP 20 instead of the GWP 100. However, methane emissions represent a small fraction of the total GHG emissions at SEA. This analysis used FAA guidance specifically provided in the FAA's Aviation Emissions and Air Quality Handbook to determine potential GHG emissions.

18.3 Scope/Categories of Emissions

GHG emissions inventories are presented in a different manner than air quality criteria pollutant emissions inventories. GHG emissions inventories are categorized into three groups, Scope 1, 2, and 3 emissions, as described below.

- Scope 1 – GHG emissions from sources owned or controlled by the Port at the Airport, including Port-owned vehicles, equipment, and stationary sources such as natural gas boilers and diesel generators. These GHGs are primarily limited to the project site.
- Scope 2 – GHG emissions from off-Airport generation of electricity purchased by the Port and consumed at the Airport. It is recognized that the estimation of GHG emissions from electricity generation is a widely accepted methodology according to international and FAA guidelines on preparing GHG emissions inventories.
- Scope 3 –GHG emissions caused by airport operations that are not under the direct control of the Port, including sources like aircraft and passenger-related motor vehicle emissions.

Furthermore, GHG emissions are categorized by the degrees of control that an airport operator may have over them. These categories are defined as follows:

- Category 1 – GHG emissions from sources that are controlled by the reporting entity, such as Port-owned GSE or vehicles and electrical consumption by the Port. In the case of an airport operator these include Scope 1 emissions but can also include some Scope 2 and Scope 3 sources over which the entity can exert some control. Examples of the latter can include personal vehicle use for business purposes that is reimbursed by the airport operator.
- Category 2 – This category comprises Scope 3 emissions associated with sources owned and controlled by airlines and airport tenants. Examples include aircraft, APUs, tenant-owned GSE, electrical consumption, and other stationary sources controlled by tenants.
- Category 3 – This category generally comprises Scope 3 emissions associated with public sources associated with the airport. Examples include private automobiles, taxis used for drop-off, limousines, buses, and shuttle vans traveling to and from the airport.

18.4 Scope 1

Port-owned vehicles used primarily on the airfield, including GSE, are considered Scope 1, Category 1.[55,56] Stationary sources used by the Port are located on Airport property and are also included in Scope 1, Category 1.

18.4.1 Port-Owned Airfield Vehicles and Equipment

The same Port-owned airfield vehicles and equipment data and assumptions developed for the air quality criteria pollutant emissions inventory was used to prepare the GHG emissions inventory. The annual GHG emissions were estimated using the following formula from the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

[55] The use of Port-owned vehicles that primarily operate on roadways, such as cars and trucks, are considered Scope 3

[56] It is acknowledged that this results in fewer Scope 1 emissions and more Scope 3 emissions; however, all of the potential Port-owned vehicle GHG emissions are included in the analysis. GHG emissions from motor vehicles operating on roadways were based on vehicle miles traveled. For reference, the Port's 2022 GHG emissions inventory for mobile sources, which is based on specific gasoline or diesel usage, accounted for approximately 1,300 tons of CO_2.

- *Equipment Emission Rate (tons/year) = Full Throttle Emission Factor (grams/hp-hour) x size (hp) x hours per year x Load Factor x Usage Factor x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

The full throttle emission factors for diesel, gasoline, and propane equipment used to estimate GHG emissions from Port-owned airfield vehicles and equipment were developed from MOVES4 and are provided in Table 3-11 in Attachment 3.[57]

The Port-owned airfield vehicles and equipment for the Existing (2022) Condition and each of the alternatives are provided in **Table 16.** Attachment 3 provides the annual usage in hours by each Port-owned GSE for the Existing (2022) Condition and each of the alternatives. As stated in Section 12.2, the annual usage was increased proportional to the forecasted increase in aircraft operations. Energy usage from Port-owned electric vehicles are discussed in Section 18.5.1.

TABLE 16: PORT-OWNED GSE – SUMMARY COMPARISON OF ANNUAL USAGE

Scenario	Fuel Type	Annual Usage (gallons)
Existing Condition	Diesel	29,608
Existing Condition	Gasoline	57,224
Existing Condition	Propane	24
Future (2032) No Action	Diesel	34,443
Future (2032) No Action	Gasoline	66,570
Future (2032) No Action	Propane	27
Future (2032) Proposed Action	Diesel	35,089
Future (2032) Proposed Action	Gasoline	67,818
Future (2032) Proposed Action	Propane	28
Future (2037) No Action	Diesel	35,031
Future (2037) No Action	Gasoline	67,707
Future (2037) No Action	Propane	28
Future (2037) Proposed Action	Diesel	37,615
Future (2037) Proposed Action	Gasoline	72,700
Future (2037) Proposed Action	Propane	30

Source: Port of Seattle and L&B, 2023.

18.4.2 Stationary Sources

GHGs for stationary sources are determined by multiplying the emission factor by the annual usage. In order to determine GHG emissions, the emission factors shown in **Table 17** were used.

TABLE 17: GHG EMISSION FACTORS FOR STATIONARY SOURCES

Fuel	CO_2	N_2O	CH_4
Natural Gas	0.05444 kg/ standard cubic foot (scf)	0.00010 g/scf	0.00103 g/scf
Diesel	10.21 kg/gallon	0.08 g/gallon	0.41 g/gallon

Note: tonnes denotes metric tons, kg denotes kilogram, g denotes gram, mmBtu denotes million British thermal units; GHG emission factors presented in the table were converted to tonnes/therm: 0.005306 tonnes CO_2/therm, 0.0000001 tonnes CH_4 /therm, and 0.00000001 tonnes N_2O/therm
Source: US EPA, Emission Factors for Greenhouse Gas Inventories, Center for Corporate Climate Leadership, April 2022, https://www.epa.gov/system/files/documents/2022-04/ghg_emission_factors_hub.pdf

[57] The Airport Support Equipment available in MOVES4 was be used for Ground Support Equipment

Natural Gas Boilers

Table 18 provides the total natural gas usage by scenario for the boilers and heaters. Specific boilers and heaters with their annual consumption are provided in Attachment 4.

TABLE 18: NATURAL GAS BOILERS AND HEATERS – SUMMARY COMPARISON OF ANNUAL USAGE

Scenario	Annual Consumption (Therms)
Existing (2022) Condition	3,170,725
2032 & 2037 No Action Alternative	3,322,066
2032 & 2037 Proposed Action	4,686,321

Source: Port of Seattle and L&B, 2024.

The No Action Alternative is anticipated to consume more natural gas than the Existing (2022) Condition because the No Action Alternative includes projects that have recently been constructed or will be constructed by 2032, including: Terminal Renovation, A Concourse Building Expansion, and C Concourse Expansion that were not included in the Existing (2022) Condition. These facilities are also included in the Proposed Action. The Proposed Action is anticipated to consume more natural gas than the No Action Alternative because the Proposed Action includes potential new facilities that would use new natural gas boilers and heaters.

Diesel Generators

In order to determine GHG emissions from generators, hours of use were converted to an annual amount of consumption in gallons. The fuel rate in gallons per hour was provided by the Port for each of the generators depending on the horsepower and the type of generator. The fuel rate was used to develop the total annual amount of diesel fuel consumed. **Table 19** provides the total diesel generators usage by scenario. Table 4-8 in Attachment 4 provides the fuel rate per generator.

The No Action Alternative is anticipated to consume more gallons of diesel than the Existing (2022) Condition because the No Action includes projects that have recently been constructed or will be constructed by 2032 that will include new diesel-powered backup generators. The Proposed Action is anticipated to consume more diesel from generators than the No Action Alternative because the Proposed Action includes potential new facilities that would require additional generators.

TABLE 19: DIESEL GENERATORS – SUMMARY COMPARISON OF ANNUAL USAGE

Scenario	Annual Usage (Hours)
Existing (2022) Condition	509.2
2032 & 2037 No Action Alternative	554.2
2032 & 2037 Proposed Action	772.4

Source: Port of Seattle and L&B, 2024.

Fuel Tanks

No GHG emissions were estimated for Jet A fuel throughput due to storage in the fuel tanks. While the storage of fuel is a potential source of evaporative hydrocarbon emissions, it does not produce the type of hydrocarbon emissions from the combustion of fuel that contribute directly to global climate change.

18.5 Scope 2

Scope 2 includes GHG emissions associated with the off-Airport generation of electricity purchased and consumed at the Airport by the Port.

18.5.1 Port of Seattle Electricity Consumption

Scope 2 GHG emissions are created as a result of electricity use in Airport buildings (e.g., Airport terminals, distribution center, bus maintenance facility, and other miscellaneous sources) and the airfield lighting which are generated from off-site power plant locations. Port electricity consumption is considered Category 2. This does not include GHG emissions associated with the generation of electricity that was provided by the Port directly to tenants. GHG emissions associated with tenant electricity consumption are considered Scope 3 and are disclosed in Section 18.6.5. GHG emissions are calculated by multiplying the emission factors and the total electrical consumption on an annual basis.

Electricity is provided to the Port by Bonneville Power Administration (BPA), Puget Sound Energy (PSE), and Seattle City Light (SCL). Emission factors per kilowatt-hour of electricity consumption are provided in **Table 20**.

TABLE 20: GHG EMISSION FACTORS FOR OFF-SITE (PURCHASED) ELECTRICITY GENERATION

Fuel	CO_2 (tonnes/kWh)
BPA Electricity Purchased	0.00001250
PSE Electricity Purchased	0.00041594
SCL Electricity Purchased	0.00000891

Note: Tonnes refers to metric tons. KWh denotes kilowatt-hour.
Source: Port of Seattle, 2023.

Table 21 provides the total electricity usage by the Port for the Existing (2022) Condition and each future scenario. The No Action Alternative includes projects that have recently been constructed or will be constructed by 2032. It is assumed that there would be no other projects that would change electricity usage between the Future (2032) No Action Alternative and the Future (2037) No Action Alternative; therefore, those projections are the same. The Future (2032) Proposed Action and the Future (2037) Proposed Action GHG emissions inventory for Port electricity consumption was based on anticipated energy use per square foot. Average electricity use per square foot for baseline conditions by each provider were used to determine the potential increase in electricity consumption that would correlate with the potential increase in square footage with the proposed new facilities. It is assumed for purposes of modeling GHG emissions that all elements of the Proposed Action would be completed by 2032.[58] There would be no known additional square footage that would change electricity usage between the Future (2032) Proposed Action and the Future (2037) Proposed Action, therefore those projections are the same.

[58] The Proposed Action could begin construction as soon as 2025 and if started then, be complete by 2032.

TABLE 21: PORT OF SEATTLE ELECTRICITY CONSUMPTION – SUMMARY COMPARISON OF ANNUAL CONSUMPTION

Scenario	Total BPA Electricity Consumption (MWH):	Total SCL Electricity Consumption (MWH):	Total PSE Electricity Consumption (MWH):	Total Electricity Consumption (MWH):
Existing (2022) Condition	117,000	2,100	2,207	121,307
2032 & 2037 No Action Alternative	122,121	2,100	2,207	126,428
2032 & 2037 Proposed Action	166,273	2,900	3,083	172,256

Note: MWh denotes megawatt-hour
Source: Port of Seattle, 2024.

18.6 Scope 3

Scope 3 includes indirect GHG emissions caused by airport operations that are not under the direct control of the Port, including sources like aircraft and motor vehicle emissions.

18.6.1 Aircraft Landing and Take-off (Includes Start-Up, Approach, Climb, and Taxiing), APUs, and Aircraft Run-Up Activity

Aircraft landing and take-off, including start-up, approach, climb, and taxiing, APUs, and aircraft run-up activity are considered Scope 3, Category 2. For all scenarios, the GHG emissions inventory was prepared by estimating the emission related to the consumption of the total fuel that was dispensed, or supplied, to aircraft at the Airport. The emission factors for Jet A LTO shown in **Table 22** will be used to determine GHG emissions from the fuel dispensed at the Airport.

TABLE 22: GHG EMISSION FACTORS FOR AIRCRAFT ENGINE FUEL

Fuel	CO_2	N_2O	CH_4
Jet A	9.75 kg/gallon	0.30 g/gallon	0.0 g/gallon

Note: CO_2 = carbon dioxide, N_2O = nitrous oxides, CH_4 = methane, kg = kilogram, g = gram.
Source: US EPA, Emission Factors for Greenhouse Gas Inventories, Center for Corporate Climate Leadership, April 2022, https://www.epa.gov/system/files/documents/2022-04/ghg_emission_factors_hub.pdf

Because aircraft operations, the use of APUs, and aircraft run-ups are expected to increase each year, the amount of fuel dispensed for the Future (2032) No Action and the Future (2037) No Action, and the Future (2032) Proposed Action and the Future (2037) Proposed Action, will be higher as compared to the Existing (2022) Condition.

18.6.2 Tenant-Owned GSE

Tenant-owned GSE are considered Scope 3, Category 2. For tenant-owned GSEs, the same data and assumptions for GSE equipment, number of operations, and operating time as developed for the criteria emissions inventory were used. Horsepower, operating time per unit and number of operations, and load factor were obtained from AEDT.

Emission factors developed in MOVES4 by fuel type and horsepower group are provided in Table 3-11 in Attachment 3. Emissions for GSEs assigned to aircraft operations were determined using the following formula.

- *Equipment Emission Rate (tons/year) = Size (hp) x Load Factor x Hours per Year x Emission Factor (g/hp-hr) x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

The tenant-owned airfield vehicles and equipment for the Existing (2022) Condition and each of the alternatives are provided in **Table 23.** Attachment 3 provides the annual usage in hours by each tenant-owned GSE for the Existing (2022) Condition and each of the alternatives.

TABLE 23: TENANT-OWNED GSE – SUMMARY COMPARISON OF ANNUAL USAGE

Scenario	Annual Usage (hours)
Existing Condition	755,174
Future (2032) No Action	893,153
Future (2032) Proposed Action	909,451
Future (2037) No Action	910,188
Future (2037) Proposed Action	975,374

Source: Port of Seattle and L&B, 2024.

18.6.3 Tenant Electricity Consumption

Tenant electricity consumption is considered Scope 3, Category 2. The GHG emissions inventory includes emissions associated with the generation of electricity provided by the Port directly to tenants, which are considered Scope 3. Electricity is used by tenant facilities including electricity for charging electrified GSE. Electricity provided by the Port and consumed by tenants is only provided by BPA. **Table 24** provides the tenant electricity usage for the Existing (2022) Condition and the future conditions.

TABLE 24: TENANT ELECTRICITY CONSUMPTION–SUMMARY COMPARISON OF ANNUAL USAGE

Scenario	Tenant BPA Electricity Consumption (MWH):
Existing (2022) Condition	26,637
No Action Alternative (2032 and 2037)	26,637
Proposed Action (2032 and 2037)	36,967

Note: MWh denotes megawatt-hour
Source: Port of Seattle, 2023.

The Proposed Action tenant electricity consumption was based on anticipated energy use per square foot. Average electricity use for baseline conditions was used to determine the potential increase in electricity consumption with the potential increase in square footage with the proposed new facilities. The Future (2032) Proposed Action and the Future (2037) Proposed Action are estimated to consume higher electricity due to the increased electricity usage to support the additional square footage in the Proposed Action scenarios.

Emission factors per kilowatt-hour of electricity were previously provided in Table 22. Emissions are calculated by multiplying the emission factors by the total annual electrical consumption by tenants and then converted using the GWP 100 values.

18.6.4 Motor Vehicles on- and off-Airport Roadways and Parking Lots (Including Airside Deliveries)

GHG emissions from motor vehicles operating on- and off-airport roadways and within select parking lots are considered Scope 3, Category 3. The GHG emissions inventory was prepared based on the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*. The GHG emissions inventory for motor vehicles was prepared using the same data and assumptions including number and type of vehicles by roadway segment, VMTs by vehicle type, and average speed as developed for the criteria emissions inventory. The EPA's MOVES4 was used to develop emission factors for use with the VMTs to determine the GHG emissions inventory provided in Attachment 5.

19. GHG Construction Emissions Inventories

The GHG construction emissions inventories were prepared using the same data and assumptions as developed for the criteria pollutant construction emissions inventories. The detailed construction phasing schedule, the assumptions of on-road and non-road construction vehicles, and the emission factors for the Proposed Action and the Hybrid Terminal Option are provided in Attachment 6.

19.1 Proposed Action - GHG Construction Emissions Inventory

The construction emissions inventory for the Proposed Action is shown in **Table 25**. As the table shows, peak construction GHG emissions are expected to occur in 2028 and produce 44,111 metric tons of CO_2e.

TABLE 25: CONSTRUCTION GHG EMISSIONS INVENTORY - PROPOSED ACTION

Year	CO_2 (CO_2e MT)	CH_4 (CO_2e MT)	N_2O (CO_2e MT)	Total CO_2e (MT)
2025	6,055	2	16	6,073
2026	25,761	14	79	25,854
2027	40,154	22	114	40,290
2028	43,967	23	121	44,111
2029	41,593	25	105	41,722
2030	29,633	19	73	29,725
2031	22,899	15	58	22,972
2032	8,458	5	20	8,482

Note: Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle and L&B, 2024.

19.2 Hybrid Terminal Option - GHG Construction Emissions Inventory

The construction emissions inventory for the Hybrid Terminal Option is shown in **Table 26**. Peak construction GHG emissions are expected to occur in 2029 and produce 48,347 metric tons of CO_2e. In 2025 and 2026, there is no difference in GHG construction emissions between the Hybrid Terminal Option and the Proposed Action. From 2027 through 2032, the Hybrid Terminal Option results in greater GHG emissions than the Proposed Action due to the change in construction phasing and the additional elements that must be constructed such as the connection to Concourse D.

TABLE 26: CONSTRUCTION GHG EMISSIONS INVENTORY - HYBRID TERMINAL OPTION

Year	CO_2 (CO_2e MT)	CH_4 (CO_2e MT)	N_2O (CO_2e MT)	Total CO_2e (MT)
2025	6,055	2	16	6,073
2026	25,761	14	79	25,854
2027	41,730	22	111	41,862
2028	48,048	24	118	48,191
2029	48,211	26	109	48,347
2030	39,235	21	81	39,337
2031	32,633	17	65	32,715
2032	12,362	5	22	12,390

Note: Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.

1 CO_2, CH_4, and N_2O, are by-products of fuel combustion. Per the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*, the storage of fuel is a potential source of evaporative hydrocarbons but does not produce the type of hydrocarbons that contribute directly to global climate change.

2 Based on FAA guidance, the estimated GHG emissions for aircraft operations, APUs, and aircraft engine ground run-ups were developed using the approximate fuel dispensed at the Airport to calculate emissions for the full flight.

Note: Totals may not sum due to rounding. Zeros may not indicate an absolute zero value. Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle, L&B, 2024.

20.2 Future (2032) No Action Alternative

The estimated annual rate (metric tons per year) of operational GHG emissions for the Future (2032) No Action Alternative is provided in **Table 28**.

TABLE 28: ANNUAL OPERATIONAL GHG EMISSIONS INVENTORY – FUTURE (2032) NO ACTION ALTERNATIVE

[1] CO_2, CH_4, and N_2O, are by-products of fuel combustion. Per the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*, the storage of fuel is a potential source of evaporative hydrocarbons but does not produce the type of hydrocarbons that contribute directly to global climate change.

[2] Based on FAA guidance, the estimated GHG emissions for aircraft operations, APUs, and aircraft engine ground run-ups were developed using the approximate fuel dispensed at the Airport to calculate emissions for the full flight.

Note: Totals may not sum due to rounding. Zeros may not indicate an absolute zero value. Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle, L&B, 2024.

20.3 Future (2032) Proposed Action

The estimated annual rate (metric tons per year) of GHG emissions for the Future (2032) Proposed Action is provided in **Table 29**. A summary comparison of the Future (2032) No Action Alternative and the Future (2032) Proposed Action GHG emissions is provided in Section 20.5.1 of this technical report.

TABLE 29: ANNUAL OPERATIONAL GHG EMISSIONS INVENTORY – FUTURE (2032) PROPOSED ACTION

2 Based on FAA guidance, the estimated GHG emissions for aircraft operations, APUs, and aircraft engine ground run-ups were developed using the approximate fuel dispensed at the Airport to calculate emissions for the full flight.

Note: Totals may not sum due to rounding. Zeros may not indicate an absolute zero value. Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle, L&B, 2024.

20.4 Future (2032) Hybrid Terminal Option

The Future (2032) Hybrid Terminal Option would have the same operational GHG emissions as the Future (2032) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same.

20.5 Comparison of 2032 Alternatives

The results of the GHG emission inventories prepared for the Future (2032) Proposed Action and the Future (2032) Hybrid Terminal Option were compared to the results of the emission inventories prepared for the Future (2032) No Action Alternative to disclose the potential increase in GHG emissions.

20.5.1 Future (2032) Proposed Action

The results of the comparison between the Future (2032) Proposed Action and the Future (2032) No Action Alternative are shown in **Table 30**. Relative to the No Action, the Proposed Action would increase operational GHG emissions by 2.1 percent in 2032. As noted earlier in this technical report, the Future (2032) Proposed Action is expected to serve more aircraft operations relative to the Future (2032) No Action. The Future (2032) Proposed Action would serve 8,755 more operations (1.9 percent) than the Future (2032) No Action Alternative. Thus, the increase in GHG emissions with the Future (2032) Proposed Action relative to the Future (2032) No Action is largely due to the higher level of airport activity that the Future (2032) Proposed Action would serve.

TABLE 30: SUMMARY OF GHG EMISSIONS, PROPOSED ACTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2032

Emissions Source	CO_2 (CO_2e MT)	CH_4 (CO_2e MT)	N_2O (CO_2e MT)	Total CO_2e (MT)
2032 No Action Alternative	7,105,199	293	68,405	7,173,897
2032 Proposed Action	7,256,518	362	69,720	7,326,600
Construction	*8,458*	*5*	*20*	*8,482*
Operational	*7,248,060*	*357*	*69,700*	*7,318,118*
2032 Increase in Emissions	*151,319*	*69*	*1,316*	*152,703*

Note: Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle and L&B, 2024.

20.5.2 Future (2032) Hybrid Terminal Option

The results of the comparison between the Future (2032) Hybrid Terminal Option and the Future (2032) No Action Alternative are shown in **Table 31**. The Future (2032) Hybrid Terminal Option would have the same operational GHG emissions as the Future (2032) Proposed Action in the same years because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same. Minor differences in construction activities for Future (2032) Hybrid Terminal Option would result in the Future (2032) Hybrid Terminal Option having slightly greater overall GHG emissions as compared to those for the Future (2032) Proposed Action.

TABLE 31: SUMMARY OF GHG EMISSIONS, HYBRID TERMINAL OPTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2032

Emissions Source	CO_2 (CO_2e MT)	CH_4 (CO_2e MT)	N_2O (CO_2e MT)	Total CO_2e (MT)

[1] CO_2, CH_4, and N_2O, are by-products of fuel combustion. Per the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*, the storage of fuel is a potential source of evaporative hydrocarbons but does not produce the type of hydrocarbons that contribute directly to global climate change.

[2] Based on FAA guidance, the estimated GHG emissions for aircraft operations, APUs, and aircraft engine ground run-ups were developed using the approximate fuel dispensed at the Airport to calculate emissions for the full flight.

Note: Totals may not sum due to rounding. Zeros may not indicate an absolute zero value. Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle, L&B, 2024.

20.8 Future (2037) Hybrid Terminal Option

As previously discussed, the Future (2037) Hybrid Terminal Option would have the same operational GHG emissions as the Future (2037) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same.

20.9 Comparison of 2037 Alternatives

The results of the GHG emission inventories prepared for the Future (2037) Proposed Action and the Future (2037) Hybrid Terminal Option were compared to the results of the emission inventories prepared for the Future (2037) No Action Alternative to disclose the potential increase in GHG emissions.

20.9.1 Future (2037) Proposed Action

The results of the comparison between the Future (2037) Proposed Action and the Future (2037) No Action Alternative are shown in **Table 34**. Relative to the Future (2037) No Action, the Future (2037) Proposed Action would increase operational GHG emissions by 7.4 percent. As noted earlier in this technical report, the Proposed Action is expected to serve more aircraft operations relative to the No Action. The Future (2037) Proposed Action would serve 35,018 more operations (7.4 percent) than the Future (2037) No Action Alternative. Thus, the increase in GHG emissions with the Future (2037) Proposed Action relative to the Future (2037) No Action Alternative is largely due to the higher level of airport activity that the Proposed Action would serve.

TABLE 34: SUMMARY OF GHG EMISSIONS, PROPOSED ACTION COMPARED TO THE NO ACTION ALTERNATIVE IN 2037

Emissions Source	CO_2 (CO_2e MT)	CH_4 (CO_2e MT)	N_2O (CO_2e MT)	Total CO_2e (MT)

2037 Increase in Emissions	*534,427*	*75*	*5,066*	*539,569*

Note: Totals may not sum due to rounding. CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, CO_2e = carbon dioxide equivalent, MT = metric tons.
Source: Port of Seattle and L&B, 2024.

20.9.2 Future (2037) Hybrid Terminal Option

The results of the comparison between the Future (2037) Hybrid Terminal Option and the Future (2037) No Action Alternative are shown in **Table 35**. The Future (2037) Hybrid Terminal Option would have the same operational GHG emissions as the Future (2037) Proposed Action because the only differences in the two alternatives would be related to the location of passenger loading bridges and aircraft hardstands. The number of future aircraft operations would be the same.

TABLE 3-1: TENANT-OWNED GSE ANNUAL USAGE - EXISTING (2022) CONDITION

General Description	AEDT Equipment Name	Annual Usage (Hours)
Aircraft Tractor	Diesel - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	11,018.3
Aircraft Tractor	Diesel - Stewart & Stevenson TUG MC - Aircraft Tractor	37.3
Aircraft Tractor	Electric - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	8,159.6
Aircraft Tractor	Gasoline - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	5,164.8
Baggage Tractor	Diesel - Stewart & Stevenson TUG MA 50 - Baggage Tractor	36,613.0
Baggage Tractor	Electric - Stewart & Stevenson TUG MA 50 - Baggage Tractor	111,509.5
Baggage Tractor	Gasoline - Stewart & Stevenson TUG MA 50 - Baggage Tractor	90,863.7
Belt Loader	Diesel - Stewart & Stevenson TUG 660 - Belt Loader	2,367.0
Belt Loader	Electric - Stewart & Stevenson TUG 660 - Belt Loader	78,062.0
Belt Loader	Gasoline - Stewart & Stevenson TUG 660 - Belt Loader	45,341.9
Cabin Service Truck	Diesel - Hi-Way F650 - Cabin Service Truck	946.0
Cabin Service Truck	Gasoline - Hi-Way F650 - Cabin Service Truck	80,841.0
Cargo Loader	Diesel - FMC Commander 30 - Cargo Loader	35,879.5
Catering Truck	Diesel - Hi-Way / TUG 660 chasis - Catering Truck	18.3
Catering Truck	Diesel - Hi-Way F650 - Catering Truck	76,956.7
Catering Truck	Gasoline - Hi-Way F650 - Catering Truck	4,788.8
Fuel Truck	Diesel - F750, Dukes Transportation Services, DART 3000 to 6000 gallon - Fuel Truck	9,726.2
Generator	Diesel - (None specified. EPA default data used.) - Generator	18.3
Ground Power Unit	Diesel - TLD, 28 VDC - Ground Power Unit	34,139.0
Ground Power Unit	Diesel - TLD, 400 Hz AC - Ground Power Unit	57.4
Ground Power Unit	Gasoline - TLD - Ground Power Unit	141.3
Hydrant Truck	Diesel - F250 / F350 - Hydrant Truck	28,896.3
Hydrant Truck	Gasoline - F250 / F350 - Hydrant Truck	3,580.4
Lavatory Truck	Diesel - TLD 1410 - Lavatory Truck	25,448.0
Lavatory Truck	Gasoline - TLD 1410 - Lavatory Truck	20,041.4
Lift	Diesel - (None specified. EPA default data used.) - Lift	1.5
Passenger Stand	Diesel - Wollard CMPS170 / CMPS228 - Passenger Stand	931.1
Service Truck	Diesel - F250 / F350 - Service Truck	5,820.3
Service Truck	Electric - F250 / F350 - Service Truck	2,037.2
Service Truck	Gasoline - F250 / F350 - Service Truck	35,768.3
	Total	**755,173.9**

TABLE 3-2: PORT-OWNED AIRFIELD VEHICLES AND EQUIPMENT ANNUAL FUEL CONSUMPTION - EXISTING (2022) CONDITION

Category / Description	AEDT Equipment Name	Fuel Type	Total Annual Consumption Per Category (Gallons)
Airfield Maintenance			
Airfield Vehicles including Ford Escapes, Chevrolet pickup trucks, Ford 150 trucks, and vans	F250 / F350 - Service Truck	Gasoline	55,461
Trimmers, pressure washers, airfield lighting	Other[1]	Gasoline	1,684
Belt Loaders	Stewart & Stevenson TUG 660 - Belt Loader	Gasoline	44
Airfield Vehicles including Ford and International trucks	F250 / F350 - Service Truck	Diesel	19,178
Snowplows including Oshkosh and International trucks	F250 / F350 - Service Truck	Diesel	5,580
Mower and snow blower equipment	Other[2]	Diesel	990
Aircraft Tractors	Douglas TBL-400 - Aircraft Tractor	Diesel	223
Forklift	Toyota 5,000 lb - Fork Lift	Propane	24
Support Hardstand Operations			
Air Conditioners	ACE 802 - Air Conditioner	Diesel	834
Shuttle Buses	COBUS[3]	Diesel	1,762
Belt Loaders	Stewart & Stevenson TUG 660 - Belt Loader	Diesel	646
Ground Power Units	TLD, 400 Hz AC - Ground Power Unit	Diesel	394
Ford 550 Service Truck	F250 / F350 - Service Truck	Gasoline	35

1 Gasoline equipment which was not available in AEDT was grouped into AEDT's "Other" equipment type. This included trimmers, pressure washers, and airfield lighting equipment. An AEDT user specified equipment type was developed with a horsepower of 126 and load factor of 0.5.

2 Diesel equipment which was not available in AEDT was grouped into AEDT's "Other" equipment type. This included mower and snow blower equipment. An AEDT user specified equipment type was developed with a horsepower of 140 and load factor of 0.5.

3 This includes the Port of Seattle 45-foot COBUS 3000 activity. An AEDT user specified equipment type was developed with a horsepower of 300 and load factor of 0.5.

Note: Hz denotes Hertz; AC denotes Air Conditioner.

Category / Description	AEDT Equipment Name	Fuel Type	Total Annual Consumption Per Category (Gallons)
Airfield Maintenance			
Airfield Vehicles including Ford Escapes, Chevrolet pickup trucks, Ford 150 trucks, and vans	F250 / F350 - Service Truck	Gasoline	65,621
Trimmers, pressure washers, airfield lighting	Other[1]	Gasoline	1,993
Belt Loaders	Stewart & Stevenson TUG 660 - Belt Loader	Gasoline	52
Airfield Vehicles including Ford and International trucks	F250 / F350 - Service Truck	Diesel	22,691
Snowplows including Oshkosh and International trucks	F250 / F350 - Service Truck	Diesel	6,602
Mower and snow blower equipment	Other[2]	Diesel	1,171
Aircraft Tractors	Douglas TBL-400 - Aircraft Tractor	Diesel	264
Forklift	Toyota 5,000 lb - Fork Lift	Propane	28
Support Hardstand Operations			
Air Conditioners	ACE 802 - Air Conditioner	Diesel	987
Shuttle Buses	COBUS[3]	Diesel	2,085
Belt Loaders	Stewart & Stevenson TUG 660 - Belt Loader	Diesel	765
Ground Power Units	TLD, 400 Hz AC - Ground Power Unit	Diesel	466
Ford 550 Service Truck	F250 / F350 - Service Truck	Gasoline	41

1 Gasoline equipment which was not available in AEDT was grouped into AEDT's "Other" equipment type. This included trimmers, pressure washers, and airfield lighting equipment. An AEDT user specified equipment type was developed with a horsepower of 126 and load factor of 0.5.

2 Diesel equipment which was not available in AEDT was grouped into AEDT's "Other" equipment type. This included mower and snow blower equipment. An AEDT user specified equipment type was developed with a horsepower of 140 and load factor of 0.5.

3 This includes the Port of Seattle 45-foot COBUS 3000 activity. An AEDT user specified equipment type was developed with a horsepower of 300 and load factor of 0.5.

Note: Hz denotes Hertz; AC denotes Air Conditioner.

TABLE 3-9: TENANT-OWNED GSE ANNUAL USAGE – FUTURE (2037) PROPOSED ACTION

General Description	AEDT Equipment Name	Annual Usage (Hours)
Aircraft Tractor	Diesel - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	14,449.1
Aircraft Tractor	Diesel - Stewart & Stevenson TUG MC - Aircraft Tractor	33.8
Aircraft Tractor	Electric - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	10,401.6
Aircraft Tractor	Gasoline - Stewart & Stevenson TUG GT-35, Douglas TBL-180 - Aircraft Tractor	6,637.5
Baggage Tractor	Diesel - Stewart & Stevenson TUG MA 50 - Baggage Tractor	47,930.4
Baggage Tractor	Electric - Stewart & Stevenson TUG MA 50 - Baggage Tractor	142,147.9
Baggage Tractor	Gasoline - Stewart & Stevenson TUG MA 50 - Baggage Tractor	119,632.2
Belt Loader	Diesel - Stewart & Stevenson TUG 660 - Belt Loader	3,017.4
Belt Loader	Electric - Stewart & Stevenson TUG 660 - Belt Loader	99,510.2
Belt Loader	Gasoline - Stewart & Stevenson TUG 660 - Belt Loader	59,674.3
Cabin Service Truck	Diesel - Hi-Way F650 - Cabin Service Truck	1,285.3
Cabin Service Truck	Gasoline - Hi-Way F650 - Cabin Service Truck	103,291.0
Cargo Loader	Diesel - FMC Commander 30 - Cargo Loader	47,382.1
Cart	Gasoline - Taylor Dunn - Cart	5.6
Catering Truck	Diesel - Hi-Way F650 - Catering Truck	99,091.3
Catering Truck	Gasoline - Hi-Way F650 - Catering Truck	6,321.9
Fuel Truck	Diesel - F750, Dukes Transportation Services, DART 3000 to 6000 gallon - Fuel Truck	12,608.5
Generator	Diesel - (None specified. EPA default data used.) - Generator	67.0
Ground Power Unit	Diesel - TLD, 28 VDC - Ground Power Unit	43,704.7
Hydrant Truck	Diesel - F250 / F350 - Hydrant Truck	37,370.8
Hydrant Truck	Gasoline - F250 / F350 - Hydrant Truck	4,630.3
Lavatory Truck	Diesel - TLD 1410 - Lavatory Truck	33,139.7
Lavatory Truck	Gasoline - TLD 1410 - Lavatory Truck	25,548.0
Lift	Diesel - (None specified. EPA default data used.) - Lift	5.6
Passenger Stand	Diesel - Wollard CMPS170 / CMPS228 - Passenger Stand	1,187.0
Service Truck	Diesel - F250 / F350 - Service Truck	7,413.9
Service Truck	Electric - F250 / F350 - Service Truck	2,597.0
Service Truck	Gasoline - F250 / F350 - Service Truck	46,290.2
	Total	**975,374.0**

Attachment 6 Construction

This attachment contains the following exhibits and tables:

Proposed Action

- Exhibit 6-1 Construction Schedule – Proposed Action
- Table 6-1 On-Road Construction Equipment Emission Factors
- Table 6-2 Non-Road Construction Equipment Emission Factors
- Table 6-3 On-Road Construction Emissions Inventory – Proposed Action
- Table 6-4 Non-Road Construction Emissions Inventory – Proposed Action

Hybrid Terminal Option

- Exhibit 6-2 Construction Schedule – Hybrid Terminal Option
- Table 6-5 On-Road Construction Emissions Inventory – Hybrid Terminal Option
- Table 6-6 Non-Road Construction Emissions Inventory – Hybrid Terminal Option

EXHIBIT 6-1: CONSTRUCTION SCHEDULE - PROPOSED ACTION

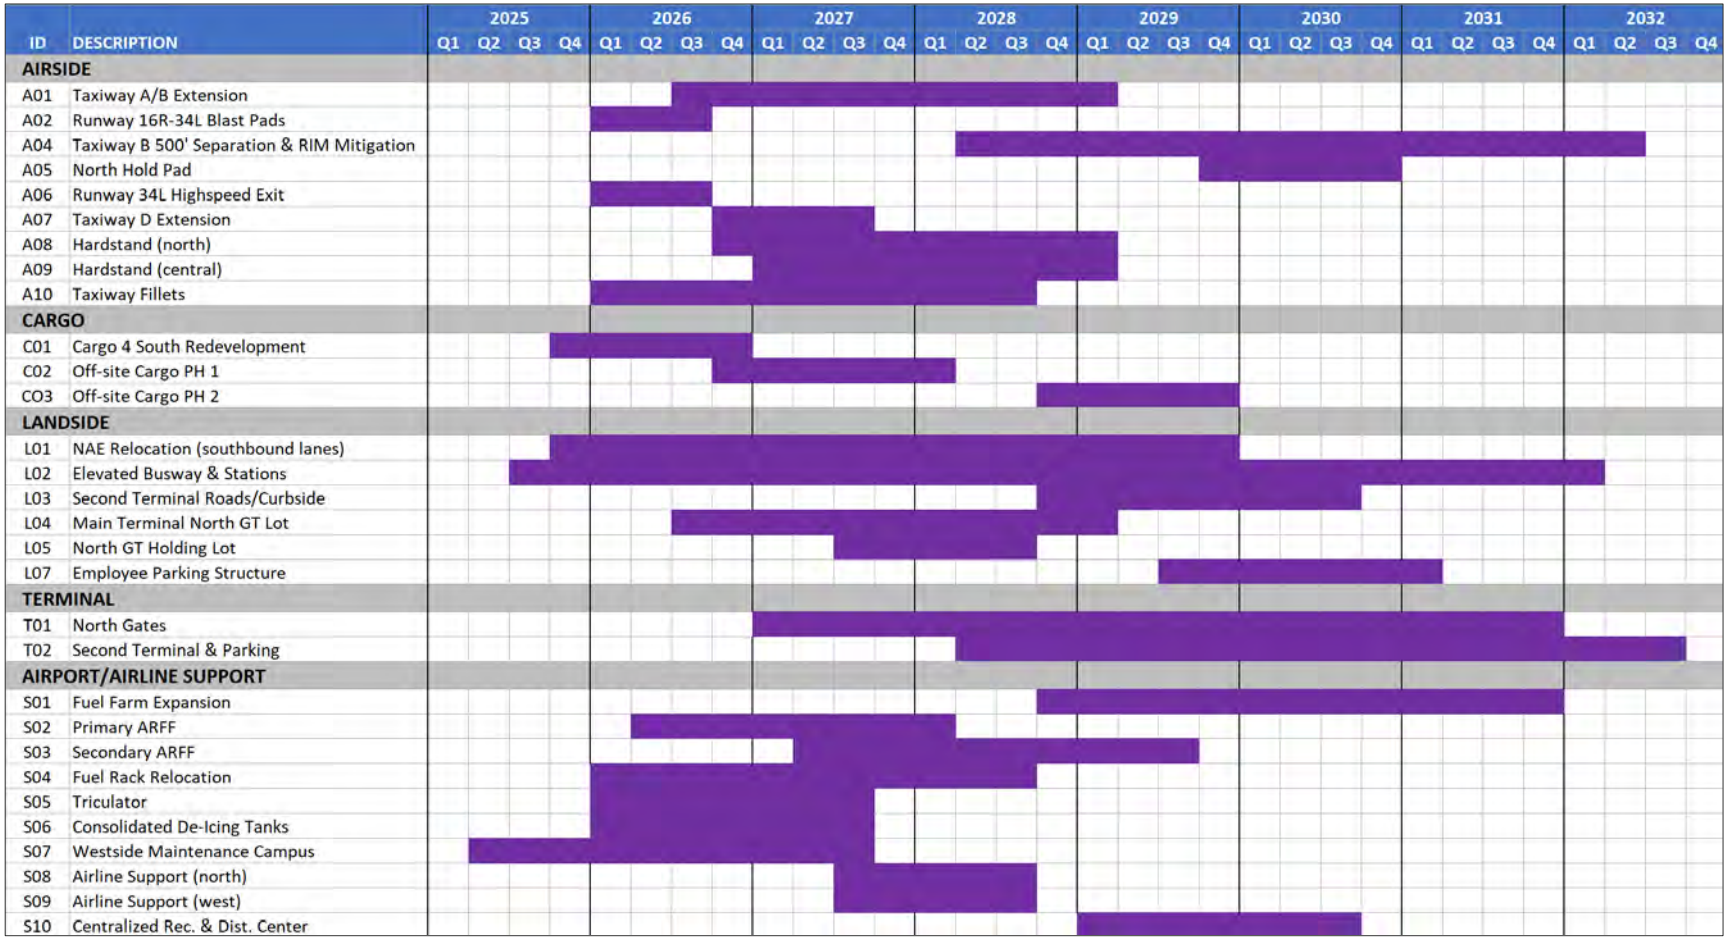

TABLE 6-1: ON-ROAD CONSTRUCTION EQUIPMENT EMISSIONS FACTORS

Activity	CO (g/VMT)	VO (g/VMT)	NO_x (g/VMT)	SO_x (g/VMT)	PM_{10} (g/VMT)	$PM_{2.5}$ (g/VMT)	CO_2 (g/VMT)	CH_4 (g/VMT)	N_2O (g/VMT)
Employee Commute	3.20	0.0309	0.112	0.00160	0.00241	0.00213	319	0.00988	0.00174
Material Delivery	2.00	0.0835	3.63	0.00548	0.0478	0.0440	1,636	0.0178	0.219

Note: Construction would start in 2025 and would continue through 2032 for the Proposed Action and the Hybrid Terminal Option. For the purpose of this analysis, emission factors for the first year of construction (2025) were used. g/VMT denotes grams per vehicle-miles-traveled; CO denotes carbon monoxide, NO_x denotes nitrogen oxides, SO_x denotes sulfur oxides, VOC denotes volatile organic compounds, $PM_{2.5}$ denotes fine particulate matter, PM_{10} denotes coarse particulate matter, CO_2 denotes carbon dioxide, CH_4 denotes methane, N_2O denotes nitrous oxide.

Note: Construction would start in 2025 and would continue through 2032 for the Proposed Action and the Hybrid Terminal Option. For the purpose of this analysis, emission factors for the first year of construction (2025) were used. Note, MOVES4 does not model N_2O for nonroad equipment; as such, emission factors for N_2O were not included in this analysis. HP denotes horsepower; LF denotes load factor; g/hp-hr denotes grams per horsepower-hour. CO denotes carbon monoxide, NO_x denotes nitrogen oxides, SO_x denotes sulfur oxides, VOC denotes volatile organic compounds, $PM_{2.5}$ denotes fine particulate matter, PM_{10} denotes coarse particulate matter, CO_2 denotes carbon dioxide, CH_4 denotes methane.

Attachment 7 NEPA Air Quality Protocol and NEPA Greenhouse Gas Protocol

This attachment contains the NEPA Air Quality Protocol and NEPA Greenhouse Gas Protocol.

After the publication of the Draft EA, Executive Order 13990, which was relied upon for the January 2023 CEQ draft GHG guidance, was revoked and CEQ revoked its regulations (40 CFR parts 1500-1508) implementing NEPA, 42 U.S.C. 4321 et seq., as amended, in response to Executive Order 14154. In addition, the Supreme Court issued the Seven County Infrastructure Coalition v. Eagle County, 605 U. S. 975 (2025) ruling on May 29, 2025. As a result of these changes, the references to climate, qualitative climate evaluation that discussed the level of preparedness with respect to the impacts of climate change, the extent to which the alternatives could be affected by future climate conditions, and if the alternatives are consistent with national, state, and local climate goals, and the cumulative impact analysis were removed from the Final EA. Though the NEPA Climate Protocol included methodology for both a climate change and cumulative impact analysis, FAA's final decision will only rely upon the GHG emissions disclosed in the Final EA.

National Environmental Policy Act Environmental Assessment

Air Quality Assessment Protocol

Seattle-Tacoma International Airport

1 Protocol for Air Quality Assessment (NEPA) 1

1.1 Purpose of this Document 1
1.2 Agency Coordination 1
1.3 Description of the Proposed Action 2
1.4 Overall Approach (NEPA) 4
1.4.1 Clean Air Act 4
1.4.2 King County Air Quality Status 6
1.4.3 Lead 7
1.4.4 Hazardous Air Pollutants (NEPA) 7
1.4.5 Ultrafine Particles (NEPA) 7
1.5 Prepare Emissions Inventories for Criteria Pollutants (NEPA) 8
1.5.1 Analysis Years 8
1.5.2 Aircraft Operational Emissions Inventory 12
1.5.3 Auxiliary Power Units Emissions Inventory 14
1.5.4 Ground Support Equipment Emissions Inventory. 14
1.5.5 Motor Vehicle Emissions Inventory 15
1.5.6 Stationary Source Emissions Inventory 18
1.5.7 Construction Emissions Inventory 18

2 Protocol for Cumulative Impact Analysis for Air Quality (NEPA) 19

2.1 Review the List of Past, Present, and Reasonably Foreseeable Future Projects 19
2.2 Identify Air Quality Impacts of the Proposed Action 20

1 Protocol for Air Quality Assessment (NEPA)

The National Environmental Policy Act (NEPA) provides for an environmental review process to disclose the potential impacts, including air quality, from a proposed federal action on the human environment.

1.1 Purpose of this Document

This document describes the overall approach and methods to conduct an air quality assessment to demonstrate compliance to the NEPA.

The Port of Seattle, as the owner and operator of the Seattle-Tacoma International Airport (SEA or Airport), evaluated airport operations and facilities during the Sustainable Airport Master Plan (SAMP) planning process and identified a set of Near-Term Projects (NTPs) designed to help the Airport maintain its essential airport function in the future. The NTPs (as a whole) are referred to as the Proposed Action in this document.

The NEPA documentation will be prepared to investigate, analyze, and disclose the potential environmental impacts of the Proposed Action and the reasonable alternatives in compliance with the NEPA.

1.2 Agency Coordination

The Port of Seattle and the FAA have coordinated with PSCAA in the past on an earlier version of this protocol document, which received concurrence from PSCAA in June 2020. In coordination with the FAA, this air quality protocol document has been updated to reflect updated analysis years, an updated methodology for air quality, and the use of newer software. The climate discussion will be included in a separate protocol document with respect to updated guidance from the Council on Environmental Quality. It is intended that this air quality protocol document be coordinated with Puget Sound Clean Air Agency in an effort to:

- Familiarize the agency with the scope of the Proposed Action and identify any issues of concern early in the process;
- Engage in data exchange of information necessary to complete the air quality assessment; and,
- Obtain concurrence on procedure and methodology prior to the publication of the anticipated NEPA Environmental Assessment (EA).

1.3 Description of the Proposed Action

The Port identified a set of NTPs to address the near-term activity levels projected to occur at the Airport. The NTPs include more than 30 projects that would improve efficiency, safety, access to the Airport, and support facilities for airlines and the Airport.

The NTPs include the following primary elements:

- Second terminal concourse
- New passenger terminal and parking
- North Airport Expressway relocation
- North hold pad
- Central hardstand
- Elevated busway and stations
- Second terminal roads and curbside
- Main Terminal north ground transportation lot
- North cargo hardstand
- Cargo 4 south redevelopment
- Cargo warehousing
- Runway 16R/34L blast pads
- Relocated Taxiways A and B
- Extension of Taxiways C and D
- Taxiway infrastructure reconfiguration (south of Taxiway O)
- Runway 34L highspeed exit
- Taxiway D extension
- Fuel farm expansion

The elements of the Proposed Action are shown on **Exhibit 1**.

Exhibit 1 Proposed Action

1.4 Overall Approach (NEPA)

The impacts to air quality due to the Proposed Action for NEPA will be determined in accordance with the guidelines provided in FAA Order 1050.1F, *Environmental Impacts: Policies and Procedures;* FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*; and FAA's Aviation Emissions and Air Quality Handbook Version 3 Update 1. Potential air quality impacts are categories that are required to be analyzed per these orders and guidance.

FAA 1050.1F, Exhibit 4-1 defines the significance threshold for air quality as when "[t]he action would cause pollutant concentrations to exceed one or more of the National Ambient Air Quality Standards (NAAQS), as established by the United States Environmental Protection Agency (USEPA) under the Clean Air Act, for any of the time period analyzed, or to increase the frequency or severity of any such existing violations." FAA guidance requests that Air Quality focus on the NAAQS criteria pollutants.

1.4.1 Clean Air Act

The Clean Air Act (CAA), including the 1990 Amendments, provides the establishment of standards and programs to evaluate, achieve, and maintain acceptable air quality in the United States. Under the CAA, the USEPA established a set of standards, or criteria, for six pollutants determined to be potentially harmful to human health and welfare.[1]

The USEPA considers the presence of the following six criteria pollutants to be indicators of air quality:

- Carbon monoxide (CO);
- Ozone (O_3);
- Nitrogen dioxide (NO_2);
- Sulfur dioxide (SO_2).
- Particulate matter (PM_{10} and $PM_{2.5}$); and,
- Lead (Pb).

For each of the criteria pollutants, the USEPA established primary standards intended to protect public health, and secondary standards for the protection of public welfare, which captures factors such as preventing materials damage, preventing crop and vegetation damage, and assuring good visibility. The NAAQS are summarized in **Table 1**. Areas of the country where air pollution levels consistently exceed these standards may be designated nonattainment by the USEPA.

[1] USEPA, Code of Federal Regulations, Title 40, Part 50 (40 CFR Part 50) National Primary and Secondary Ambient Air Quality Standards (NAAQS), July 2011.

Table 1 National Ambient Air Quality Standards

POLLUTANT	PRIMARY/ SECONDARY	AVERAGING TIME	LEVEL	FORM OF MEASUREMENT
Carbon Monoxide	Primary	8 hour	9 ppm	Not to be exceeded more than once per year
Carbon Monoxide	Primary	1 hour	35 ppm	Not to be exceeded more than once per year
Lead	primary and secondary	Rolling 3-month average	0.15 µg/m3 (1)	Not to be exceeded
Nitrogen Dioxide	Primary	1 hour	100 ppb	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Nitrogen Dioxide	primary and secondary	1 year	53 ppb (2)	Annual Mean
Ozone	primary and secondary	8 hour	0.070 ppm (3)	Annual fourth-highest daily maximum 8-hr concentration, averaged over 3 years
Fine Particulate Matter ($PM_{2.5}$)	Primary	1 year	12.0 µg/m^3	Annual mean, averaged over 3 years
Fine Particulate Matter ($PM_{2.5}$)	Secondary	1 year	15.0 µg/m^3	Annual mean, averaged over 3 years
Fine Particulate Matter ($PM_{2.5}$)	primary and secondary	24 hour	35 µg/m^3	98th percentile, averaged over 3 years
Coarse Particulate Matter (PM_{10})	primary and secondary	24 hour	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide	Primary	1 hour	75 ppb (4)	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Sulfur Dioxide	Secondary	3 hour	0.5 ppm	Not to be exceeded more than once per year

(1) In areas designated nonattainment for the Pb standards prior to the promulgation of the current (2008) standards, and for which implementation plans to attain or maintain the current (2008) standards have not been submitted and approved, the previous standards (1.5 µg/m3 as a calendar quarter average) also remain in effect.

(2) The level of the annual NO2 standard is 0.053 ppm. It is shown here in terms of ppb for the purposes of clearer comparison to the 1-hour standard level.

(3) Final rule signed October 1, 2015, and effective December 28, 2015. The previous (2008) O3 standards are not revoked and remain in effect for designated areas. Additionally, some areas may have certain continuing implementation obligations under the prior revoked 1-hour (1979) and 8-hour (1997) O3 standards.

(4) The previous SO2 standards (0.14 ppm 24-hour and 0.03 ppm annual) will additionally remain in effect in certain areas: (1) any area for which it is not yet 1 year since the effective date of designation under the current (2010) standards, and (2)any area for which an implementation plan providing for attainment of the current (2010) standard has not been submitted and approved and which is designated nonattainment under the previous SO2 standards or is not meeting the requirements of a SIP call under the previous SO2 standards (40 CFR 50.4(3)). A SIP call is an EPA action requiring a state to resubmit all or part of its State Implementation Plan to demonstrate attainment of the required NAAQS.

Notes: ppm is parts per million; ppb is parts per billion, and µg/m3 is micrograms per cubic meter.

Source: EPA, https://www.epa.gov/criteria-air-pollutants/naaqs-table, Accessed December 2022.

A nonattainment area is a homogeneous geographical area (usually referred to as an air quality control region or airshed) that is in violation of one or more NAAQS and has been designated as nonattainment by the USEPA as provided for under the CAA. Each nonattainment area is required to have a State Implementation Plan (SIP), developed by the state that quantifies current conditions, projects future conditions through the date of prescribed attainment, and then identifies mitigation measures that are to be used to bring the area back into attainment.

A maintenance area describes the air quality designation of an area previously designated nonattainment by the USEPA and subsequently redesignated attainment after emissions are reduced. Such an area remains designated as maintenance for a period up to 20 years at which time the state can apply for redesignation to attainment, provided that the NAAQS were sufficiently maintained throughout the maintenance period.

1.4.2 King County Air Quality Status

SEA is located within King County, Washington, which is included in the Puget Sound Intrastate Air Quality Control Region. The area was previously designated maintenance for ozone under the 1-hour 1979 ozone standard; however, the 1-hour standard was revoked by USEPA effective June 15, 2005. The maintenance period for ozone ended on November 25, 2016.[2] The region is currently designated as in attainment for both the 2015 and 2008 8-hour ozone standard. The region is not subject to a maintenance plan for ozone, although ozone has been considered an important pollutant tracked by the state and local agencies.

In the past, King County was also designated as nonattainment for carbon monoxide (CO); however, on October 11, 1996, the USEPA determined the area had attained the standard and the region was redesignated to attainment of the 1971 standard. The maintenance period for CO ended on October 11, 2016.[3] Several areas within King County are classified as maintenance for the PM_{10} (coarse particles) standard, including Kent, Duwamish and Tacoma. Neither the Proposed Action nor any part of the Airport is within any of these areas. Therefore, the Proposed Action will occur in an area considered in attainment for all criteria pollutants.

1.4.2.1 Conformity

General Conformity

The General Conformity Rule under the CAA is conducted in three phases, depending on the extent of the proposed Federal action: (1) applicability, (2) evaluation, and (3) determination. The applicability phase has two parts. The first part is to determine if the Proposed Action is located in a USEPA-designated nonattainment or maintenance area for one or more of the regulated criteria pollutants. If it is not, then the general conformity rule does not apply. Since the Proposed Action is not located in a USEPA-designated nonattainment or maintenance area for one or more of the regulated criteria pollutants, the general conformity rule does not apply.

Transportation Conformity

Transportation conformity does not apply to the Proposed Action because it does not include actions funded through U.S.C. Title 23 or the Federal Transit Act.

[3] State of Washington's Department of Ecology. Plans for Maintaining Air Quality. Website accessed December 2022 at https://ecology.wa.gov/Regulations-Permits/Plans-policies/State-implementation-plans/Maintenance-SIPs

1.4.3 Lead

In general, an analysis of lead is limited to projects that emit significant quantities of the pollutant (i.e. lead smelters). While some active general aviation airports prepare lead emissions inventories due to the large quantity of leaded Avgas used, this is not warranted for SEA because the area is attainment for lead, Avgas fueling at SEA ceased in 2018, and because there are no development project elements in the Proposed Action that would affect or change Avgas-based aircraft.

1.4.4 Hazardous Air Pollutants (NEPA)

Per FAA guidance provided in the Aviation Emissions and Air Quality Handbook, a Hazardous Air Pollutants (HAPs) emissions inventory should be considered if the Proposed Action is considered “major” (e.g., new airport, new runway, major runway extension, new terminal or major terminal expansion or major construction activity); if the Proposed Action is located in a nonattainment or maintenance area; and/or if a criteria air pollutant emissions inventory is also prepared. A HAPs inventory analysis will not be conducted as part of the NEPA assessment because the Proposed Action is not located in a nonattainment or maintenance area.

1.4.5 Ultrafine Particles (NEPA)

UFPs are defined as particles with a diameter less than 0.1 micrometers ($PM_{0.1}$). The existing science is not fully mature, and the measurement and understanding of UFPs and their related health risks has not been clearly defined. Currently UFPs are not regulated by the USEPA or the state either through rate of emissions or concentrations (other than being a subset component of $PM_{2.5}$) and are therefore not typically considered in formal environmental assessments or reviews.

Furthermore, since UFPs are not specifically listed as a criteria pollutant, air toxic, or HAP, an analysis of UFPs will not be considered a requirement of NEPA or the CAA. Therefore, no analysis or discussion of UFPs will be included in the NEPA evaluation.

1.5 Prepare Emissions Inventories for Criteria Pollutants (NEPA)

An emissions inventory is a summary of the total pollutants generated by all active emissions sources that may be affected by the Proposed Action. The emissions inventory provides the total annual pollutant emissions as tons per year.

The elements of the Proposed Action would be anticipated to cause direct and indirect emissions from construction and operational activities. For NEPA purposes, construction refers to the process of building or putting in place the proposed airport improvements. Operational emissions refer to the emissions that are emitted once the proposed improvements are put in place and are operating.

Therefore, an air quality analysis incorporating separate evaluations will be conducted including:

- Preparation of an Aircraft Emissions Inventory including Auxiliary Power Unit (APU) emissions;
- Preparation of a Motor Vehicle and Ground Support Equipment Emissions Inventory;
- Preparation of a Stationary Source Emissions Inventory; and,
- Preparation of a Construction Emissions Inventory.

The emissions results for all inventories will be summed and will be provided in tabular form for each analysis year.

As previously stated, a separate climate protocol document will be developed. The methodology to evaluate impacts to climate due to the Proposed Action for NEPA will be developed in accordance with the guidelines provided in FAA Order 1050.1F, *Environmental Impacts: Policies and Procedures*; FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*; FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*; and the CEQ's *National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change*.

1.5.1 Analysis Years

The air quality analysis will disclose emissions for existing conditions, which will represent calendar year 2022. The analysis will also disclose the emissions and potential air quality impacts due to operation of the Proposed Action, No Action, and any identified alternatives for the projected future conditions in 2032 and 2037. The year 2032 will be used as a basis for analysis because 2032 is the projected opening year of the Proposed Action. In addition, 2037 will be used as a basis for analysis, because it represents a condition five years beyond the opening year.[4] The air quality analysis will also disclose the potential air quality impacts due to construction activities during the years 2025 to 2032. Because the area of the Proposed Action is in attainment and conformity does not apply, no potential SIP milestone years will be analyzed.

The overall criteria pollutant assessment approach to prepare the emissions inventories is summarized in **Table 2**.

4 The FAA's Desk Reference Section 11.3 states "The environmental consequences section of the NEPA document will include the analysis of the potential noise impacts of the proposed action and alternative(s) for each timeframe evaluated… Timeframes usually selected are the year of anticipated project implementation and 5 to 10 years after implementation." The FAA's Desk Reference Section 1.3.2 for air quality states, "the emissions inventory usually is calculated for the year(s) of project implementation, the planning horizon year(s) in the EA or EIS, and sometimes for intermediate years, if appropriate due to project phasing or if requested by a reviewing agency." The air quality analysis would be conducted consistent with the noise analysis and therefore include an assessment of the implementation year and of the project five years after implementation.

Table 2 NEPA Approach for Emissions Inventories

Emissions Source	Data / Conditions	Data Source	Models to be Used
Aircraft	Number of operations, Fleet Mix, and Engine Types	For existing conditions, FAA's Air Traffic Activity Data System and the Port's EnvironmentalVue Flight Track Monitoring System. For future conditions, Port aircraft statistics and forecast of operations.	FAA AEDT
Aircraft	Taxi Time and other Aircraft Times in Modes	For existing conditions, the Port of Seattle will use FAA's Aviation System Performance Metrics (ASPM). For future conditions, the Port of Seattle will use the delay analysis developed with the Total Airspace and Airport Modeler (TAAM) tool normalized to the ASPM data.[5]	FAA AEDT
Aircraft	Auxiliary Power Unit (APU) Operating Times	For existing and future conditions, the AEDT database will be used to assign the APU type and the Port of Seattle's Rules and Regulations will be used to assign APU usage.	FAA AEDT
Aircraft	Aircraft Run-Ups	For existing conditions, Port of Seattle records will be used. For the future conditions, usage would be based on the increases in aircraft levels.	FAA AEDT

[5] Leigh Fisher. Environmental Review Airside Modeling, June 2020.

Emissions Source	Data / Conditions	Data Source	Models to be Used
Ground Support Equipment (GSE)	GSE equipment types, Fuel types, and Operating Times	*Tenant-Owned* For existing conditions, a GSE survey (i.e., field verification and Port of Seattle data) will be used to identify equipment types and usage. Usage for future conditions would be increased based on the increases in aircraft levels. *Port-Owned* Additionally, for existing conditions, Port-owned airfield vehicles and equipment usage would be obtained from the Port. Usage for future conditions would be adjusted based on the increases in aircraft levels.	FAA AEDT
Motor Vehicles	Number of vehicles by roadway segment, Vehicle Miles Travelled (VMTs) by vehicle type and average speed	*Off-Airport Roadways* For existing and future conditions, information from the surface transportation study developed for the NEPA EA will be used. Where data is not being collected for roadway segments within the study area, WSDOT data will be utilized. *On-Airport Roadways* For existing conditions, Port of Seattle information on the number and types of airside delivery vehicles accessing the airfield through security gates. For future conditions, the increase would be based on the increase in passenger levels. *Parking Facilities* For existing conditions, information from the Port of Seattle would be used. For future conditions, the increase would be based on the increase in passenger levels and aircraft operations.	USEPA's MOVES3

Emissions Source	Data / Conditions	Data Source	Models to be Used
Stationary Sources	Number, type, and usage for emergency generators, boilers, and fuel tanks, the usage of which may be affected by the Proposed Action	For existing conditions, Port of Seattle records will be used. For future conditions, estimates will be based on increases in aircraft and passenger levels and anticipated new facilities.	FAA AEDT and USEPA AP-42 and other regional Puget Sound Clean Air Agency guidance documents, spreadsheet calculations.
Construction Equipment	Number and type of vehicles, duration of use	Port of Seattle construction phasing schedule, ACEIT database for types and usage of construction equipment, MOVES3 emission factors for King County, WA.	ACEIT and USEPA's MOVES3

Source: Port of Seattle and L&B, 2022.

1.5.2 Aircraft Operational Emissions Inventory

The number and type of aircraft operations directly affect emissions. The emission inventory for aircraft operations will be developed using the AEDT model Version 3e. AEDT models aircraft performance in space and time to estimate fuel consumption, air quality emissions, and noise consequences at airports. Aircraft emissions depend partly on the physical characteristics and performance parameters of each unique aircraft type. These include the airframe type, the type and number of engines, takeoff weight, and approach angle.

In addition to the physical characteristics of the aircraft operating at the Airport, emissions further depend on the number of times that each aircraft type operates in the various modes that define a landing and takeoff cycle (LTO). An LTO consists of the approach, taxi in, startup, taxi out, takeoff, and climb out. In AEDT, these modes are reported as time below mixing height and climb below mixing height.

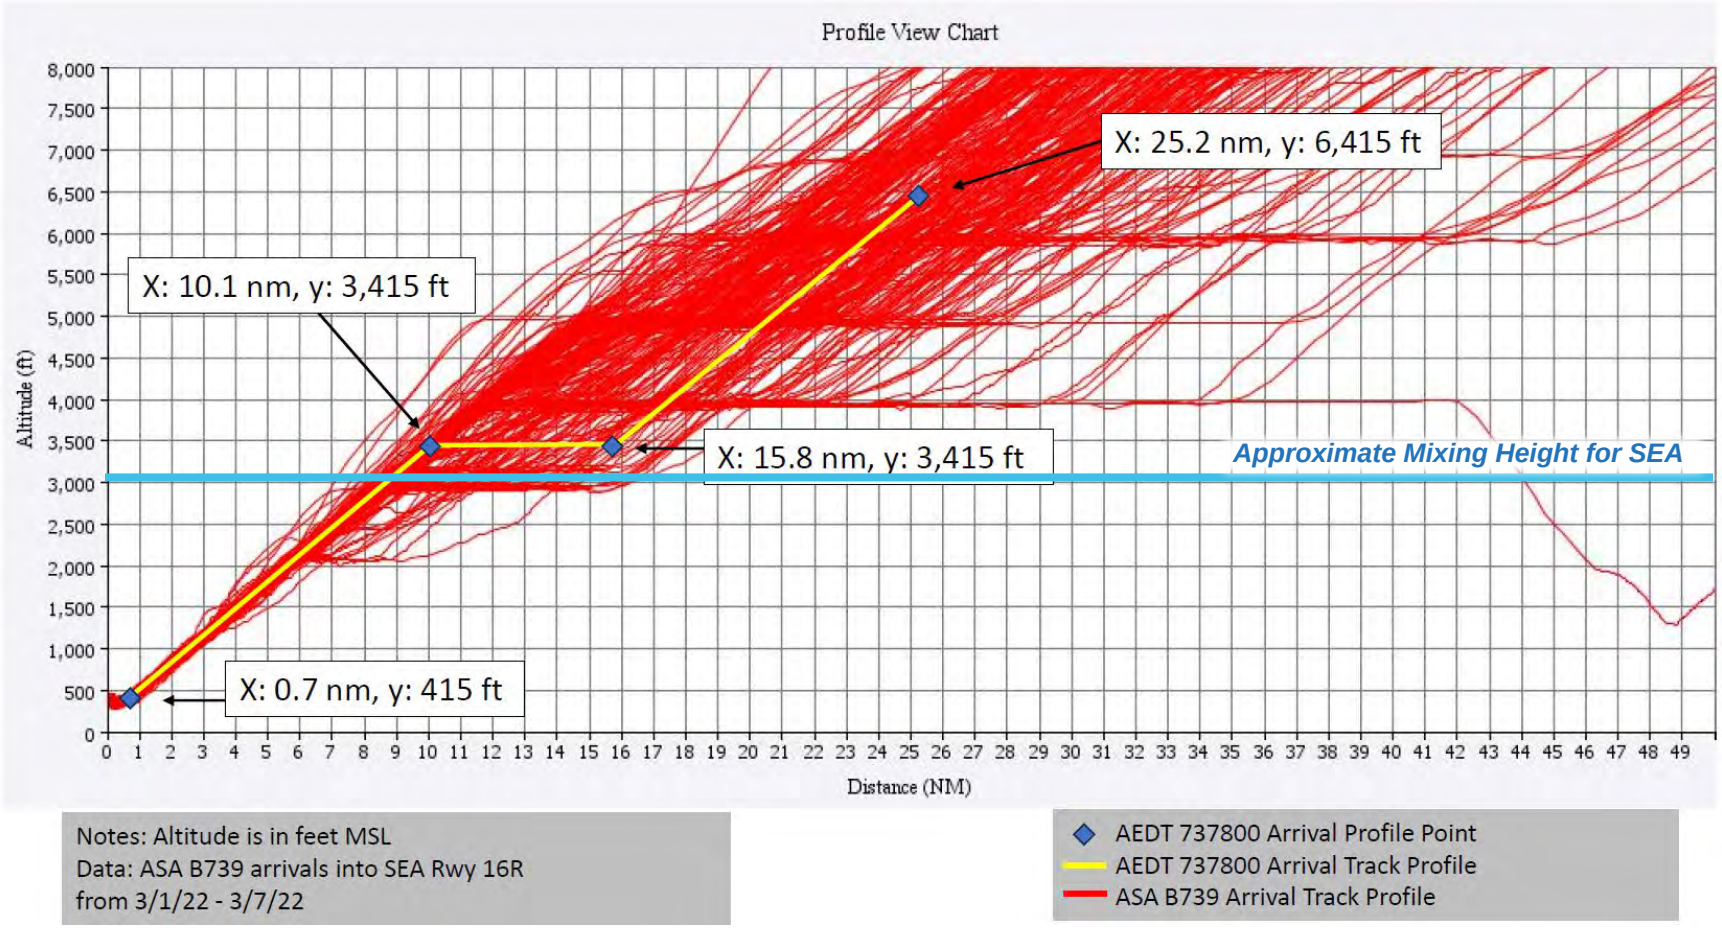
For the NEPA EA, emissions from aircraft will only be calculated when aircraft are operating in these modes within the atmospheric mixing layer, below the mixing height, where the emissions may influence ground-based pollutant concentrations. The mixing height, by definition, is the height below which emissions will be readily mixed to the surface in a time frame of a few minutes to an hour. Thus, the pollutants emitted within this mixing layer are the most important. The mixing height, combined with the angle of approach and the departure angle, determines the total time an aircraft operates in the mixing layer during approach and climb out, and thus potentially impacts human health. The mixing height used in this assessment will be defined as 3,084 feet in altitude above field elevation, which is the recommendation by the FAA based on the USPEA's *Mixing Heights, Wind Speeds, and Potential for Urban Air Pollution Throughout the Contiguous United States*.[6]

Information on the number and type of aircraft operations for the existing conditions will be obtained from the Port of Seattle and by FAA's Air Traffic Activity Data System (ATADS) radar data. The radar data will be used to develop flight tracks in the AEDT. Additional data including aircraft types and engine combinations will then be researched and downloaded from the Port's EnvironmentalVue Flight Track Monitoring System. The assigning of aircraft engines will be based on the specific airframe and the operator. This information will be used to develop a representative aircraft fleet for input into the AEDT model. A review of radar data and the AEDT database confirmed the standard profiles included in AEDT are representative of actual aircraft performance (altitude, speed, thrust) at SEA. See **Exhibit 2** for an example of the comparison of an arrival aircraft altitude with the AEDT arrival standard profile conducted for the purpose of the NEPA EA.

With or without the Proposed Action, aircraft operations are expected to increase each year and by 2037, the number of annual aircraft operations will be higher as compared to the existing condition. Information on the number and type of aircraft operations for the future Proposed Action, No Action, and any identified alternatives will be based on the Port of Seattle's future aircraft activity forecasts and operational analysis. It is anticipated that the Proposed Action alternative will include a higher number of aircraft operations than the No Action alternative in both the 2032 and 2037 timeframes. The resulting emissions from these conditions will be disclosed as part of the analysis. Aircraft operational emissions inventories will be prepared for the existing condition, Proposed Action (2032 and 2037), No Action (2032 and 2037), and any identified alternatives. A qualitative discussion on the FAA's Continuous Lower Energy, Emissions, and Noise (CLEEN) Program and the Port of Seattle's sustainable fuel goals and how they could reduce future emissions will also be included.

[6] USEPA. Mixing Heights, Wind Speeds, and Potential for Urban Air Pollution Throughout the Contiguous United States, January 1972. Page 110. Seattle, Washington has a reported diurnal variation of mixing heights between 705 meters (2,313 feet) and 1,175 meters (3,855 feet), with the daily average being 940 meters (3,084 feet).

Exhibit 2 Radar Data and AEDT Arrival Profile Comparison



1.5.2.1 Taxi Time and other Aircraft Times in Mode

The Proposed Action includes various elements that would have the potential to change average aircraft taxi time (delay time) at the Airport. The average taxi in and taxi out time is dependent on the airfield configuration, annual operating levels, and available facilities. The average taxi in and taxi out time for the existing conditions will be based on the FAA's operations and performance data for SEA including Aviation System Performance Metrics (ASPM).

The average taxi in and taxi out time for the future conditions will be determined by delay modeling developed with the Total Airspace and Airport Modeler (TAAM) tool normalized to ASPM. This information will be provided by the Port of Seattle.[7]

1.5.2.2 Aircraft Run-Ups

Aircraft engine ground run-ups are routine aircraft engine maintenance tests performed to test engines and diagnose engine issues. Aircraft run-up activity logs will be provided by the Port of Seattle to determine the amount of run-up operations, the location of the run-up, average duration, and the associated airframe and engine in the existing conditions. Run-up activity in the future conditions will be based on the Port of Seattle's future aircraft activity forecasts and operational analysis.

1.5.3 Auxiliary Power Units Emissions Inventory

Most of the larger jet aircraft use auxiliary power units (APUs) while at the gate to operate the heating, air conditioning, and electric systems. The APU is also used to 'start up' or restart the aircraft engines before departing from the gate or cargo area. APU usage is within the control of the pilot; therefore, APU use and emissions can vary greatly from one airline/operator to another and even one aircraft to another. Most of the smaller general aviation aircraft in the SEA aircraft fleet do not have APUs. Additionally, the use of hardstand and cargo operations (when aircraft are not using gates and jet bridges) impacts the amount of APU emissions. For the existing and future conditions analysis, the AEDT database will be used to assign the specific types of APU used for each aircraft type and the Port of Seattle's Rules and Regulations will be used to determine APU usage.

1.5.4 Ground Support Equipment Emissions Inventory.

Typical ground support equipment (GSE) includes baggage tractors, belt loaders, and catering vehicles that support airport operations.

1.5.4.1 Tenant-Owned

A GSE survey (i.e., field verification and Port of Seattle data) will be used in AEDT modeling of tenant-owned GSE. The survey will be used to identify the most commonly used GSE types and duration of usage for a select group of representative aircraft by airline operating at the Airport. The results of the survey will be used to develop the AEDT inputs for GSE by aircraft operation. Usage for future conditions would be increased based on the increases in aircraft levels. Operational emissions from vehicles such as catering trucks that operate on airport roadways beyond the immediate vicinity of the aircraft will be quantified in the motor vehicle emissions inventory (see Section 1.5.5).

1.5.4.2 Port-Owned GSE

The airport maintains a fleet of GSE vehicles such as sweepers, and other portable equipment such as pressure washers and lighting trailers. GSE owned by the Port of Seattle that are determined not to be included in the GSE for each aircraft operation, will be modeled in AEDT as a separate population.

[7] Leigh Fisher. Environmental Review Airside Modeling, June 2020.

1.5.5 Motor Vehicle Emissions Inventory

1.5.5.1 Off-Airport Roadways

Motor vehicles operating on off-airport roadways include passenger cars, light duty and heavy-duty trucks, and buses. These vehicles are also referred to as Ground Access Vehicles (GAVs). The study area to be used for this air quality analysis will be the same as that used for the surface transportation study developed for the NEPA EA. The surface transportation study intersections are shown in **Exhibit 3** and the resulting air quality study area is shown in **Exhibit 4**. The USEPA's Motor Vehicle Emissions Simulator version 3 (MOVES3) will be used to develop the emissions inventory for GAVs on roadways that may be directly affected by the Proposed Action.

The Proposed Action includes roadway changes that will offer a greater level of efficiency for GAVs than the No Action, resulting in less idling of engines:

- Construct approximately 7,300 linear feet of new Airport roadways to access the new Second Terminal.
- New Vehicle Service Road bridge over S 188 Street.
- Elevated Busway: Construct a 6,000 linear foot elevated busway to provide a landside connection for non-secure passengers to transfer among the Main Terminal, New Second Terminal, and Rental Car Facility.
- Charter/Cruise Ground Transportation Lot: Expand the existing ground transportation lot on the north side of the existing parking garage.

The Proposed Action also includes relocation of facilities including employee parking lots and cargo facilities that may cause GAVs to travel a further distance.

Each roadway segment to be analyzed for the No Action and Proposed Action scenarios will be measured to define the distance. Data pertaining to the existing number of vehicles traveling on each roadway will be obtained from the surface transportation study being conducted for this project. Where data is not being collected for roadway segments within the study area, WSDOT data will be utilized. MOVES3 will be used to assign the type of vehicles distribution, fuel efficiency, etc. applicable to King County. The Port of Seattle is preparing a surface transportation study to forecast the potential number of vehicles on future roadways included in the Proposed Action. The results of the surface transportation study will be used to determine the motor vehicle emissions for the existing, Proposed Action (2032 and 2037), and No Action (2032 and 2037) conditions.

1.5.5.2 On-Airport Roadways

Additionally, motor vehicles operate on airport roadways related to airside deliveries, which include light duty and heavy-duty trucks, and buses. Information on the number and types of airside delivery vehicles accessing the airfield through security gates will be obtained from the Port. The NEPA emissions inventory for mobile sources will include vehicle activity related to airside deliveries.

1.5.5.3 Parking Facilities

Additionally, motor vehicles operate on airport parking facilities, which include passenger cars, light duty and heavy-duty trucks, and buses. Only emissions for vehicles in parking facilities where it is reasonable to anticipate changes in vehicle traffic due to the Proposed Action would be estimated. The NEPA emissions inventory for mobile sources will include vehicle activity related to parking facilities.

Exhibit 3 Surface Transportation Study Intersections

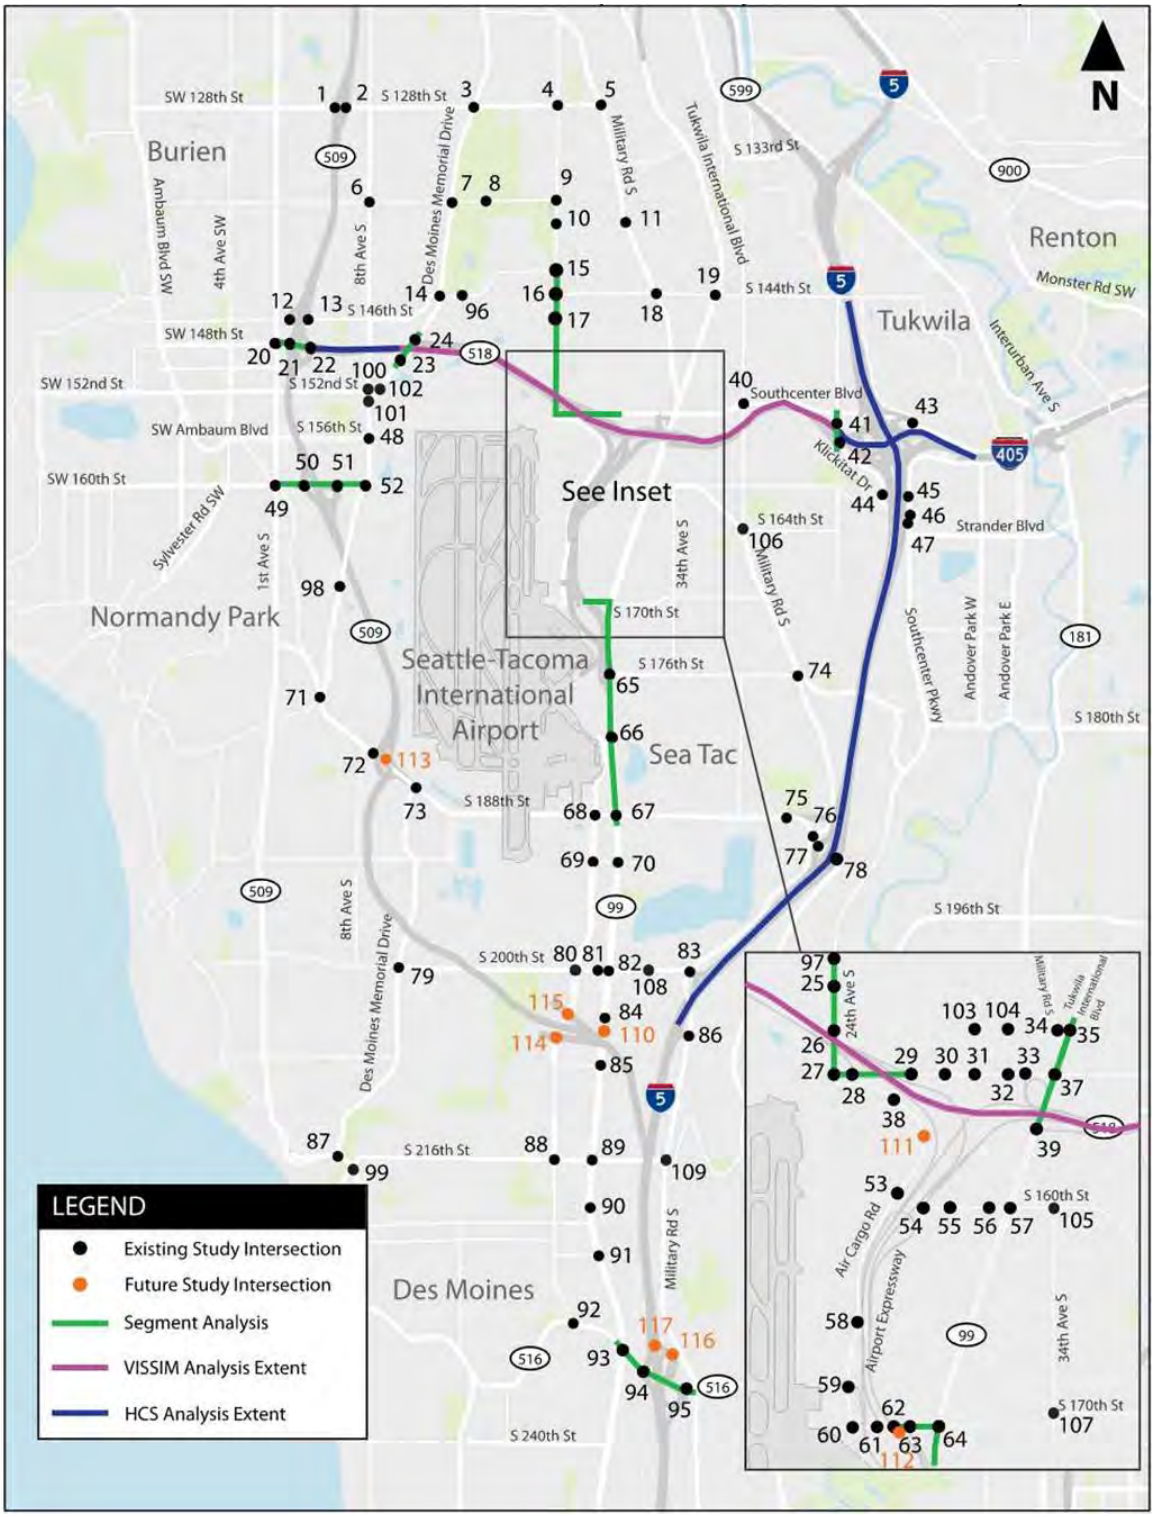


Exhibit 4 Air Quality Study Area

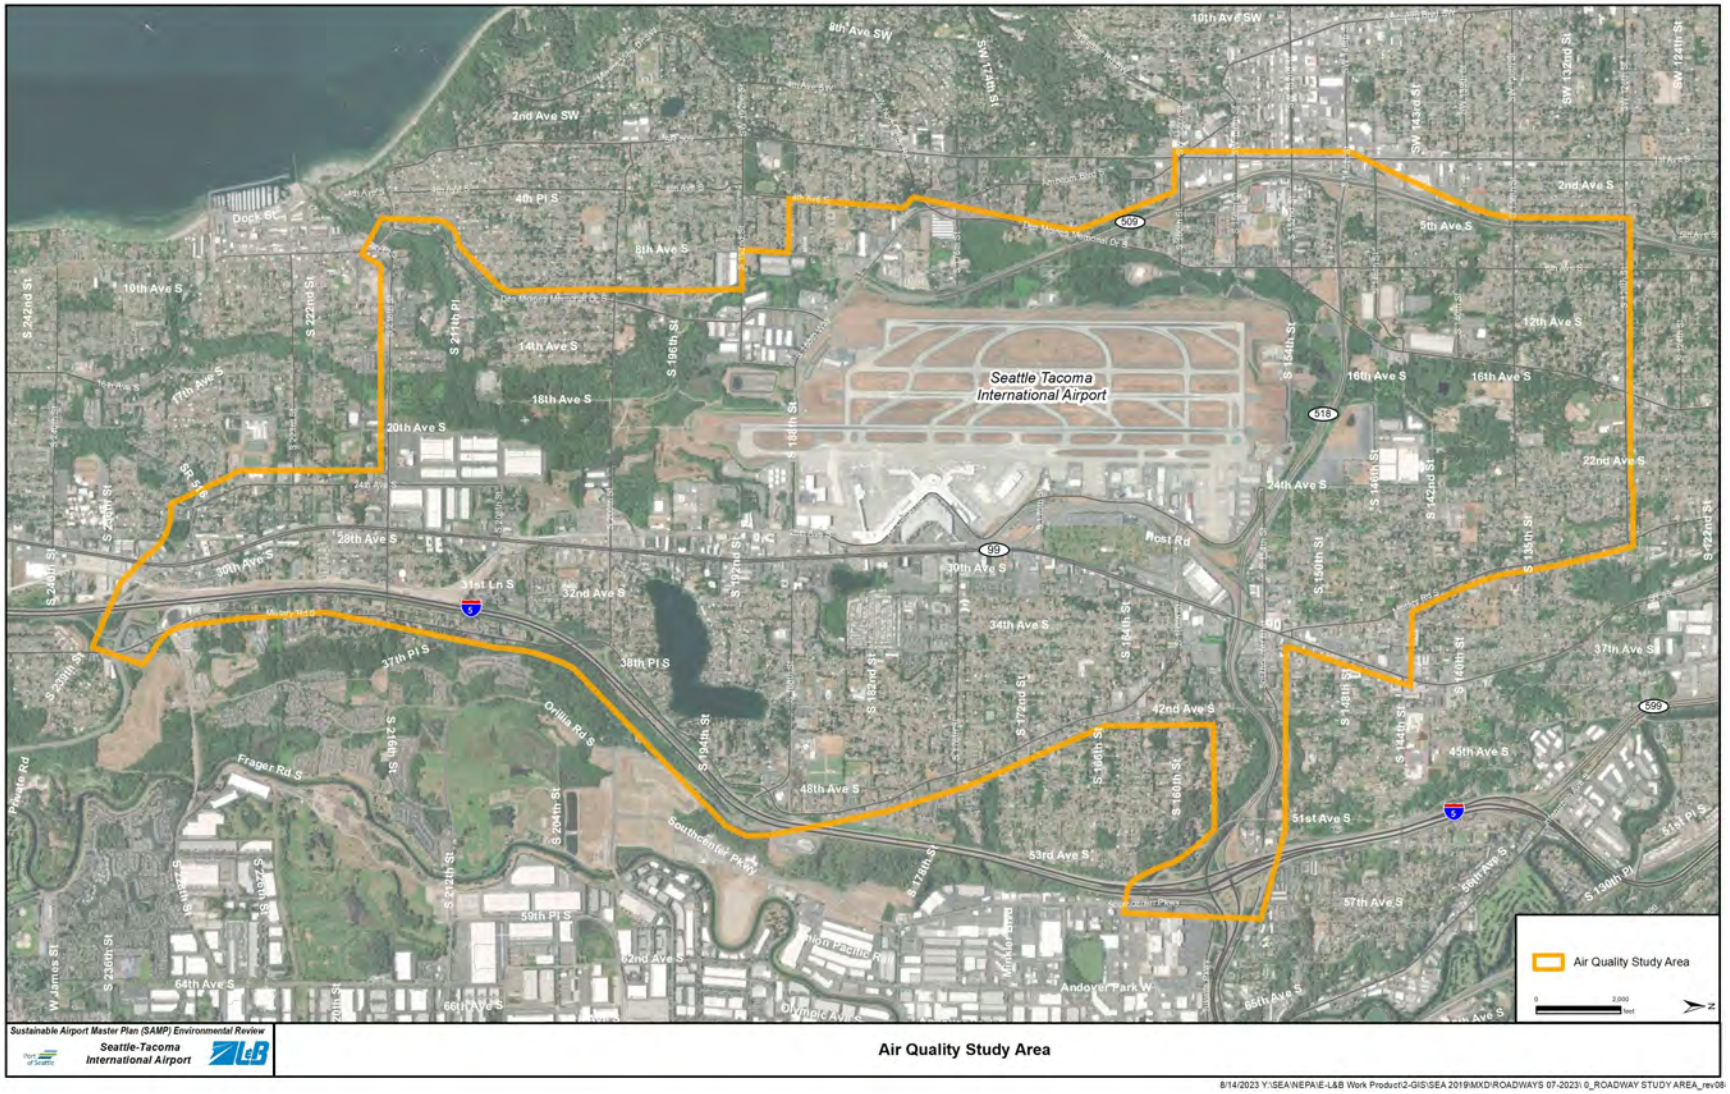

1.5.6 Stationary Source Emissions Inventory

Stationary sources of air pollution include generators, boilers, and fuel tanks located on airport property which may be directly affected by the Proposed Action. The emission inventory for stationary sources will be developed using FAA's AEDT based on the type of stationary source equipment and the duration of its usage. The Proposed Action includes construction and use of additional fuel tanks. Inputs to estimate fuel tank emissions include the size of the tank, type of fuel, and the fuel throughput. Assumptions and emission factors will be based on USEPA AP-42 and other regional Air Quality Management District guidance documents, should a particular equipment type not exist within the AEDT model.

Data will be obtained from the Port of Seattle on the existing use of stationary sources, on an annual basis, which will be projected for 2032 and 2037 for the No Action scenario based on increases of aircraft and passenger levels where applicable. Data will also be obtained from the Port of Seattle for the estimated number and type of stationary sources including anticipated heating and cooling systems and backup generators associated with the proposed new facilities that would be used for the Proposed Action scenario in 2032 and 2037.

1.5.7 Construction Emissions Inventory

Temporary air quality impacts would result from construction activities associated with the Proposed Action. Air pollutants would be emitted by construction equipment and fugitive dust generated during demolition and construction of the proposed development. Construction activities associated with the Proposed Action are set to begin in 2025 and all projects being in construction by 2032. A detailed construction phasing schedule will be used to identify which projects will occur between 2025 and 2032. Potential sources of construction emissions include construction vehicles and equipment. Emissions for on-road and non-road construction equipment will be estimated separately following standard industry practices.

Non-Road Construction Equipment

Potential non-road construction emissions will be estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

Equipment Emission Rate (tons/year) = Full Throttle Emission Factor (grams/hp-hour) x size (hp) x hours per year x Load Factor x usage Factor x (1 pound/453.59 grams) x (1 ton/2,000 pounds)

Data will be obtained from the Port of Seattle concerning each phase of construction, the duration of the phase, the tasks to be completed, and other additional information for input into the Airport Construction Emissions Inventory Tool (ACEIT) to estimate the type of construction equipment, horsepower, load factor, and operating hours for each project element and phase. The ACEIT was developed by the Airport Cooperative Research Program (ACRP) and the equipment and assumptions used in the program are drawn from ACRP Report 102, Guidance for Estimating Airport Construction Emissions. The USEPA's MOVES3 model will be used to identify the emission factor of each criteria air pollutant for each equipment type. Non-road construction equipment emissions will be calculated based on the number of operating hours of equipment use and the emission factors.

Evaporative VOC emissions associated with the application of hot mix asphalt will be estimated using the formula provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1.*

Asphalt VOCs Emissions Rate (tons/year) = 0.053 tons/acre of asphalt placed x acres of asphalt placed per year

The emissions results for all equipment will be summed and will be provided in tabular form for each year of construction.

On-Road Construction Vehicles

Potential on-road construction emissions will be estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

> *Emission Rate (tons/year) for on-road vehicles = Emission Factor (grams/mile) x miles per day x # of days/year x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

Emission factors for on-road construction vehicles will be developed using the MOVES3 model. For employee vehicle trips related to construction activities, the model will be run using gasoline passenger vehicles including cars and light duty pickup trucks. For material delivery and off-site haul vehicle trips, diesel combination long-haul trucks will be assumed in order to estimate maximum potential emissions.

Total vehicle miles traveled (VMT) for vehicles operating during each Proposed Action element and for each type of on-road construction activity during each construction year will be estimated. This includes construction employee vehicle trips to and from the job site using model default distances. The analysis will also include material delivery trips and off-site hauling trips using heavy duty trucks using model default distances. Potential on-road construction emissions will be estimated by multiplying the VMT data by the appropriate emission factors and the necessary conversion factors to present the criteria air pollutant emissions in tons. The results will be provided in tabular form for each year of construction.

2 Protocol for Cumulative Impact Analysis for Air Quality (NEPA)

The Council on Environmental Quality (CEQ) Regulations define a cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (see 40 CFR § 1508.7). The analysis of cumulative impacts recognizes that while the impacts of individual actions may be small, when combined with the impacts of past, present, and reasonably foreseeable future actions on populations or resources in and around SEA, the impacts could be potentially significant.

Pursuant to FAA guidance, past, present, and reasonably foreseeable future actions must be considered in determining whether there are potential cumulative impacts. Based on the guidance from 1050.1F Desk Reference, "[t]he significance of cumulative impacts should be determined in the same manner as the significance of direct and indirect impacts." FAA Order 1050.1F uses the same threshold of significance for project significant impacts as it does for cumulative impacts.

2.1 Review the List of Past, Present, and Reasonably Foreseeable Future Projects

Past Projects

CEQ NEPA regulations require analysis of past actions to the extent they are relevant and useful in analyzing whether the reasonably foreseeable effects of the current action combined with the past action would create cumulative effects. It is important to note that according to the CEQ's memorandum, *Guidance on the Consideration of Past Actions in Cumulative Effects Analysis*, focus should be on whether the information from past projects is "relevant to reasonably foreseeable significant adverse impacts," is "essential to a reasoned choice among alternatives," and can be obtained without exorbitant cost. Furthermore, present impacts of past actions that are relevant and useful are those that may have a significant cause-and-effect relationship with the

direct and indirect impacts of the proposed action and alternative(s). Only information that is useful to decision-makers and the public should be included, and the CEQ warns against including extraneous background data.

For this analysis, past projects are defined as those which occurred within the past seven years (between 2015 and 2022). This timeframe goes back far enough to provide a reasonable historical context about the current state of the resource.[8]

Present Projects

Present projects are any actions occurring within the same study area as the existing conditions for the Proposed Action.

Reasonably Foreseeable Future Projects

Reasonably foreseeable future projects are defined as actions that are likely to be completed within the time period from 2022 through 2032 and that have been developed with enough specificity to provide meaningful data for analysis. No projects past 2032 are included because there is a lack of adequate detail about those later projects to enable meaningful review; any analysis of those projects or their impacts would be speculative.

2.2 Identify Air Quality Impacts of the Proposed Action

A review will be conducted of the air quality analyses that have been undertaken for the cumulative projects identified (past, present, and reasonably foreseeable future projects). A qualitative evaluation of the air quality cumulative impacts with consideration of the cumulative projects' will be developed.

Note, the NEPA EA will evaluate the potential air quality impacts on environmental justice communities (areas where minority and low-income populations represent a higher fraction of the population compared with the general population) independent of the air quality analysis. As such, an environmental justice impact analysis will not be included in the air quality analysis.

[8] The FAA has discretion to determine whether, and to what extent, information about the specific nature, design, or present impacts of a past action are useful for the analysis of the impacts of the proposed action and alternative(s).

National Environmental Policy Act Environmental Assessment

Climate Assessment Protocol

Seattle-Tacoma International Airport

August 2023

Revised August 17, 2023

PREPARED FOR

Port of Seattle

After the publication of the Draft EA, Executive Order 13990, which was relied upon for the January 2023 CEQ draft GHG guidance, was revoked and CEQ revoked its regulations (40 CFR parts 1500-1508) implementing NEPA, 42 U.S.C. 4321 et seq., as amended, in response to Executive Order 14154. In addition, the Supreme Court issued the Seven County Infrastructure Coalition v. Eagle County, 605 U. S. 975 (2025) ruling on May 29, 2025. As a result of these changes, the references to climate, qualitative climate evaluation that discussed the level of preparedness with respect to the impacts of climate change, the extent to which the alternatives could be affected by future climate conditions, and if the alternatives are consistent with national, state, and local climate goals, and the cumulative impact analysis were removed from the Final EA. Though this protocol included methodology for both a climate change and cumulative impact analysis, FAA's final decision will only rely upon the GHG emissions disclosed in the Final EA.

1 Protocol for Climate Assessment (NEPA)

The National Environmental Policy Act (NEPA) provides for an environmental review process to disclose the potential impacts, including climate, from a proposed federal action on the human environment. Additionally, the Council on Environmental Quality (CEQ) issued guidance for agencies in January 2023 to guide the quantification of reasonably foreseeable GHG emission for the proposed action, no action alternative, and any reasonable alternatives, using available information and data.

1.1 Purpose of this Document

This document describes the overall approach and methods to conduct a climate assessment to demonstrate compliance to the NEPA, including the January 2023 CEQ guidance.

The Port of Seattle, as the owner and operator of the Seattle-Tacoma International Airport (SEA or Airport), evaluated airport operations and facilities during the Sustainable Airport Master Plan (SAMP) planning process and identified a set of Near-Term Projects (NTPs) designed to help the Airport maintain its essential airport function in the future. The NTPs (as a whole) are referred to as the Proposed Action in this document.

The NEPA documentation will be prepared to investigate, analyze, and disclose the potential environmental impacts of the Proposed Action and any identified alternatives in compliance with the NEPA.

1.2 Agency Coordination

The Port of Seattle and the FAA coordinated an air quality protocol with the Puget Sound Clean Air Agency (PSCAA) in 2020 that included the proposed climate assessment methodology. The air quality protocol was updated in 2023 to reflect changes in the analysis years and the use of newer software. During this update, the Port of Seattle and the FAA decided to create a separate climate assessment protocol. It is intended that this climate assessment protocol document be coordinated with the PSCAA in an effort to:

- Familiarize the agency with the scope of the Proposed Action and identify any issues of concern early in the process;
- Engage in data exchange of information necessary to complete the climate assessment; and,
- Obtain concurrence on procedure and methodology prior to the publication of the anticipated NEPA Environmental Assessment (EA).

1.3 Description of the Proposed Action

The Port identified a set of NTPs to address the near-term activity levels projected to occur at the Airport. The NTPs include more than 30 projects that would improve efficiency, safety, access to the Airport, and support facilities for airlines and the Airport.

The NTPs include the following primary elements:

- Second terminal concourse
- New passenger terminal and parking
- North Airport Expressway relocation
- North hold pad
- Central hardstand

- Elevated busway and stations
- Second terminal roads and curbside
- Main Terminal north ground transportation lot
- North ground transportation holding lot
- North cargo hardstand
- Cargo 4 south redevelopment
- Cargo warehousing
- Runway 16R/34L blast pads
- Relocated Taxiways A and B
- Extension of Taxiways C and D
- Taxiway infrastructure reconfiguration (south of Taxiway O)
- Runway 34L highspeed exit
- Taxiway D extension
- Fuel farm expansion
- Employee parking structure

The elements of the Proposed Action are shown on **Exhibit 1**.

Exhibit 1 Proposed Action

2 Prepare Climate Assessment (NEPA)

The impacts to climate due to the Proposed Action for NEPA will be determined in accordance with the guidelines provided in FAA Order 1050.1F, *Environmental Impacts: Policies and Procedures;* FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*; FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*; and the CEQ's *National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change.* Per these guidelines, the climate assessment will include the development of a NEPA greenhouse gas (GHG) emissions inventory, disclosure of estimated GHG emissions, and a qualitative climate evaluation for the proposed action, no action alternative, and any reasonable alternatives as detailed below.

2.1 Develop Greenhouse Gas (GHG) Emissions Inventory (NEPA)

A GHG emissions inventory is a summary of the GHG pollutants generated by all active emissions sources that may be affected by the Proposed Action. The GHG emissions inventories are prepared based on actual and/or estimated energy or fuel consumption or vehicle miles travelled (VMTs) and an appropriate emission factor.

The elements of the Proposed Action would be anticipated to cause direct and indirect GHG emissions from construction and operational activities. For NEPA purposes, construction refers to the process of building or putting in place the proposed airport improvements. Operational emissions refer to the emissions that are emitted once the proposed improvements are put in place and are operating.

Therefore, a climate analysis incorporating separate evaluations will be conducted including the preparation of:

- Aircraft GHG Emissions Inventory including Auxiliary Power Unit (APU) GHG emissions;
- Motor Vehicle and Ground Support Equipment (GSE) GHG Emissions Inventory;
- Stationary Source GHG Emissions Inventory;
- Electricity Consumption GHG Emissions Inventory; and,
- Construction GHG Emissions Inventory.

2.1.1 Short Term and Long-Term Effects

According to CEQ's *National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change*, "[w]hen considering effects, agencies should take into account both the short and long-term adverse and beneficial effects using a temporal scope that is grounded in the concept of reasonable foreseeability. Agencies should identify an appropriate lifetime for the proposed action using available indicators and guided by the concept of reasonable foreseeability."

The GHG emissions will be disclosed for existing conditions, which will represent calendar year 2022. The GHG emissions and potential climate impacts due to the operation of the Proposed Action, No Action, and any identified alternatives for the projected future conditions in 2032 and 2037 will be estimated and disclosed. The year 2032 will be used as a basis for analysis because 2032 is the projected opening year of the Proposed Action. In addition, 2037 will be used as a basis for analysis, because it represents a condition five years beyond the opening year, and is consistent with the analysis years used for noise and air quality (criteria pollutant) analysis.[1] The climate assessment will also disclose the potential climate impacts due to construction activities during the years 2025 to 2032.

1 The FAA's Desk Reference Section 11.3 states "The environmental consequences section of the NEPA document will include the analysis of the potential noise impacts of the proposed action and alternative(s) for each timeframe

A qualitative discussion will be included in the NEPA EA regarding the potential emissions over the projected lifetime of the Proposed Action and any identified alternatives past 2037.[2]

2.1.2 Greenhouse Gases and Global Warming Potential

GHGs are gases that trap heat in the earth's atmosphere. The primary GHGs which will be the focus of this assessment include the following:

- **Carbon dioxide (CO_2)**, which enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), agriculture, irrigation, and deforestation, as well as the manufacturing of cement.
- **Methane (CH_4)**, which is emitted through the production and transportation of coal, natural gas, and oil, as well as from livestock. Other major human-caused sources of methane emissions include agricultural activities, and the decay of waste in landfills and wastewater treatment plants.
- **Nitrous oxide (N_2O)**, which at airports is released most often during the burning of fuel at high temperatures. This greenhouse gas is caused mostly by agricultural soil management, but also by motor vehicles, which also include non-road vehicles, such as those used for agriculture.

Two key ways in which these GHGs differ from each other are their ability to absorb energy and how long they stay in the atmosphere. The Global Warming Potential (GWP) was developed to allow comparisons of the global warming impacts of different gases by converting each gas amount to a carbon dioxide equivalent (CO_2E).[3] GWPs provide a common unit of measure, which allows for one emission estimate of the different GHGs. CO_2 has a GWP of one because it is the gas used as the reference point. For this analysis, GWPs would be based on a 100-year period provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1* and based on the Intergovernmental Panel on Climate Change (IPCC), Fifth Assessment Report (AR5).[4] Methane does not last as long in the atmosphere as CO_2 , however, it absorbs much more energy. Therefore, one ton of methane has 34 times more heat capturing potential than one ton of carbon dioxide. The amount of methane emissions will be multiplied by 34 to determine its CO_2E value. Nitrous oxide lasts in the atmosphere far longer than CO_2. The amount of nitrous oxide emissions will be multiplied by 298 to determine its CO_2E value.

The NEPA GHG emissions inventory will be conducted to provide the estimate of the annual rate (metric tons per year) of GHG emissions attributable to airport sources for each analysis year.

evaluated… Timeframes usually selected are the year of anticipated project implementation and 5 to 10 years after implementation." The FAA's Desk Reference Section 1.3.2 for air quality states, "the emissions inventory usually is calculated for the year(s) of project implementation, the planning horizon year(s) in the EA or EIS, and sometimes for intermediate years, if appropriate due to project phasing or if requested by a reviewing agency." The air quality analysis would be conducted consistent with the noise analysis and therefore include an assessment of the implementation year and of the project five years after implementation.

2 Because the lifetime of airport projects are virtually unlimited if well maintained, decommissioning of the airport is not included as part of this analysis.

3 EPA, 2017, Understanding Global Warming Potentials. https://www.epa.gov/ghgemissions/understanding-global-warming-potentials, Accessed August 2017.

4 There are also 20-year GWP values which prioritizes gases with shorter lifetimes. For example, the GWP 20 value for methane is 86, according to IPCC AR5, as compared to the GWP 100 value of 34. There is no difference between GWP 100 and GWP 20 for CO_2 and only a minor difference for nitrous oxide (GWP 100 is 298 and GWP 20 is 268). It is acknowledged that GHG emissions, especially for methane, would be higher using the GWP 20 instead of the GWP 100. This analysis used FAA guidance specifically provided in the FAA's Aviation Emissions and Air Quality Handbook to determine potential GHG emissions.

2.1.3 Scope/Categories of Emissions

GHG emissions inventories are presented in a different manner than air quality criteria pollutant emissions inventories. GHG emissions inventories are categorized into three groups, Scope 1, 2, and 3 emissions, as described below.

- Scope 1 – GHG emissions from sources owned or controlled by the Port at the Airport, including Port-owned vehicles, equipment, and stationary sources such as natural gas boilers and diesel generators. These GHGs are primarily limited to the project site.
- Scope 2 – GHG emissions from off-Airport generation of electricity purchased by the Port and consumed at the Airport. It is recognized that the estimation of GHG emissions from electricity generation is a widely accepted methodology according to international and FAA guidelines on preparing GHG emissions inventories.
- Scope 3 –GHG emissions caused by airport operations that are not under the direct control of the Port, including sources like aircraft and passenger-related motor vehicle emissions.

Furthermore, GHG emissions are categorized by the degrees of control that an airport operator may have over them. These categories are defined as follows:

- Category 1 – GHG emissions from sources that are controlled by the reporting entity, such as Port-owned ground support equipment (GSE) or vehicles and electrical consumption by the Port. In the case of an airport operator these include Scope 1 emissions but can also include some Scope 2 and Scope 3 sources over which the entity can exert some control. Examples of the latter can include personal vehicle use for business purposes that is reimbursed by the airport operator.
- Category 2 – This category comprises Scope 3 emissions associated with sources owned and controlled by airlines and airport tenants. Examples include aircraft, APUs, tenant-owned GSE, electrical consumption, and other stationary sources controlled by tenants.
- Category 3 – This category generally comprises Scope 3 emissions associated with public sources associated with the airport. Examples include private automobiles, taxis used for drop-off, limousines, buses, and shuttle vans traveling to and from the airport.

2.1.4 Operational Emissions Sources

The overall GHG assessment approach to develop the operational emissions inventories for NEPA is summarized in **Table 1**, with further details following.

Table 1 NEPA Approach for GHG Emissions Inventories

Emissions Source	Data / Conditions	Data Source	Models to be Used	Scope and Category
Aircraft	Fuel Dispensed	For existing conditions, fuel dispensed will be used to estimate emissions from aircraft fuel consumption. For future conditions, the fuel consumption would be based on the increases in aircraft levels.	Fuel Emission Factors from FAA *Aviation Emissions and Air Quality Handbook Version 3 Update 1*	Scope 3, Category 2
Aircraft	Auxiliary Power Unit (APU) Operating Times	For existing and future conditions, the AEDT database will be used to assign the APU type and the Port of Seattle's Rules and Regulations will be used to assign APU usage. The AEDT output will be used to determine hours of APU run time per type/model.	Fuel flow rates and Emission Factors from FAA *Aviation Emissions and Air Quality Handbook Version 3 Update 1.* Number of APU, fuel type, operating time from AEDT.	Scope 3, Category 2
Ground Support Equipment (GSE)	GSE equipment types, Fuel types, and Operating Times	*Tenant-Owned* For existing conditions, a GSE survey (i.e., field verification and Port of Seattle data) will be used to identify equipment types and usage. Usage for future conditions would be increased based on the increases in aircraft levels.	Emission factors from USEPA's MOVES3 and FAA *Aviation Emissions and Air Quality Handbook Version 3 Update 1.* Number of GSE, fuel type, operating time from AEDT.	Scope 3, Category 2

Emissions Source	Data / Conditions	Data Source	Models to be Used	Scope and Category
Ground Support Equipment (GSE)	GSE equipment types, Fuel types, and Operating Times	*Port-Owned* For existing conditions, Port-owned airfield vehicles and equipment usage would be obtained from the Port. Usage for future conditions would be based on the increases in aircraft levels. The AEDT output will be used to determine hours of GSE run time per type/model.	Emission factors from USEPA's MOVES3 and FAA *Aviation Emissions and Air Quality Handbook Version 3 Update 1.* Number of GSE, fuel type, operating time from AEDT.	Scope 1, Category 1
Motor Vehicles	Number of vehicles by roadway segment, Vehicle Miles Travelled (VMTs) by vehicle type and average speed	*Off-Airport Roadways* For existing and future conditions, information from the surface transportation study developed for the NEPA EA will be used. Where data is not being collected for roadway segments within the study area, WSDOT data will be utilized. *On-Airport Roadways* For existing conditions, Port of Seattle information on the number and types of airside delivery vehicles accessing the airfield through security gates. For future conditions, the increase would be based on the increase in passenger levels. *Parking Facilities* For existing conditions, information from the Port of Seattle would be used. For future conditions, the increase would be based on the increase in passenger levels and aircraft operations.	USEPA's MOVES3	Scope 3, Category 3

Emissions Source	Data / Conditions	Data Source	Models to be Used	Scope and Category
Stationary Sources	Number, type, and usage for emergency generators, boilers, and fuel tanks, the usage of which may be affected by the Proposed Action	For existing conditions, Port of Seattle records will be used. For future conditions, estimates will be based on increases in aircraft and passenger levels and anticipated new facilities.	Fuel consumption from Port records and Emission Factors from USEPA.	Scope 1, Category 1
Electricity Consumption	*Port of Seattle Electricity Consumption* Electricity use in Airport buildings, airfield lighting	For existing conditions, Port of Seattle records will be used. For the future conditions, electricity consumption would be based on the change in new facility square footage for each scenario.	Port to provide emission factors	Scope 2, Category 1
Electricity Consumption	*Tenant Electricity Consumption* Electricity provided by the Port directly to tenants	For existing conditions, Port of Seattle records will be used. For the future conditions, electricity consumption would be based on the change in square footage for each scenario.	Port to provide emission factors	Scope 3, Category 2

Port of Seattle and L&B, 2023.

2.1.5 Aircraft

Aircraft activity at the Airport are considered Scope 3, Category 2. The existing GHG emission inventory for aircraft operations, APU use, and aircraft engine ground run-ups will be developed using the fuel dispensed at the Airport to estimate emissions from aircraft activity. With or without the Proposed Action, aircraft operations and aircraft engine ground run-ups are expected to increase each year and by 2037, the number of annual aircraft operations will be higher as compared to the existing condition. For future conditions, the fuel consumption would be based on the increases in aircraft levels. The resulting operational emissions from these conditions will be disclosed as part of the analysis for the existing condition, Proposed Action (2032 and 2037), No Action (2032 and 2037), and any identified alternatives.

The emission factors for Jet A LTO shown in **Table 2** will be used to determine GHG emissions from the fuel dispensed at the Airport.

Table 2 GHG Emission Factors for Aircraft Fuel

Fuel	CO_2	N_2O	CH_4
Jet A- LTO	9.75 kg/gallon	0.30 g/gallon	0.0 g/gallon
Jet A- Startup mode	9.75 kg/gallon	0.30 g/gallon	0.0 g/gallon
Avgas LTO/Startup	8.31 kg/gallon	0.11 g/gallon	7.06 g/gallon

Source: US EPA, Emission Factors for Greenhouse Gas Inventories, Center for Corporate Climate Leadership, April 2022, https://www.epa.gov/system/files/documents/2022-04/ghg_emission_factors_hub.pdf

2.1.6 Auxiliary Power Units

Most of the larger jet aircraft use auxiliary power units (APUs) while at the gate to operate the heating, air conditioning, and electric systems. The APU is also used to 'start up' or restart the aircraft engines before departing from the gate or cargo area. APU usage is within the control of the pilot; therefore, APU use and emissions can vary greatly from one airline/operator to another and even one aircraft to another.

APUs are considered Scope 3, Category 2. Most of the smaller general aviation aircraft in the SEA aircraft fleet do not have APUs. Additionally, the use of hardstand and cargo operations (when aircraft are not using gates and jet bridges) impacts the amount of APU emissions. For the existing and future conditions analysis, the AEDT database will be used to assign the specific types of APU used for each aircraft type. The Port of Seattle's Rules and Regulations will be used to determine existing and future APU usage.

The AEDT will be used to estimate the hours of usage and type of APU equipment. Fuel usage will be determined using the following formula from the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

> *Fuel Usage (gallons) = Fuel Flow Rate (pounds per hour) x Operating Time (minutes) x number of operations x 1 hour per 60 minutes / 6.84 pounds per gallon*

Fuel flow rates (pounds per hour) will be taken from the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1 Table C-2*. Operating time will come from the Port of Seattle's Rules and Regulations and number of operations will be based on aircraft operations as developed through AEDT modeling. Once the number of gallons is determined, the emission factors for Jet A Startup mode shown in **Table 2** will be used to determine GHG emissions.

2.1.7 Ground Support Equipment

Typical ground support equipment (GSE) includes baggage tractors, belt loaders, and catering vehicles that support airport operations. Annual GHG emissions will be determined using the following formula from the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

> *Equipment Emission Rate (tons/year) = Full Throttle Emission Factor (grams/hp-hour) x size (hp) x hours per year x Load Factor x Usage Factor x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

The full throttle emission factor will be developed from MOVES3.[5] Horsepower, operating time per unit and number of operations, and load factor will be obtained from the AEDT outputs as detailed below.

2.1.7.1 Tenant-Owned

Tenant-owned GSE are considered Scope 3, Category 2. A GSE survey (i.e., field verification and Port of Seattle data) will be used in AEDT modeling of tenant-owned GSE. The survey will be used to identify the most commonly used GSE types and duration of usage for a select group of representative aircraft by airline operating at the Airport. The results of the survey will be used to develop the AEDT inputs for GSE by aircraft operation. The AEDT will provide the estimated annual usage for each GSE type and the FAA's equipment emission rate equation identified in Section 2.1.7 will be used to estimate the annual tenant-owned GSE emissions. Usage for future conditions would be increased based on the increases in aircraft levels. Operational emissions from vehicles such as catering trucks that operate on airport roadways beyond the immediate vicinity of the aircraft will be quantified in the motor vehicles NEPA GHG emissions inventory.

2.1.7.2 Port-Owned GSE

The airport maintains a fleet of GSE vehicles such as sweepers, and other portable equipment such as pressure washers and lighting trailers used on the airfield. Port-owned GSE vehicles are considered Scope 1, Category 1. GSE owned by the Port of Seattle that are determined not to be included in the GSE for each aircraft operation, will be modeled in AEDT as a separate population.

2.1.8 Stationary Source

Stationary sources of air pollution include generators, boilers, and fuel tanks located on airport property which may be directly affected by the Proposed Action. Stationary sources used by the Port are also included in Scope 1, Category 1. The emission inventory for stationary sources will be developed using FAA's AEDT based on the type of stationary source equipment and the duration of its usage. The Proposed Action includes construction and use of additional fuel tanks. Inputs to estimate fuel tank emissions include the size of the tank, type of fuel, and the fuel throughput. Assumptions and emission factors will be based on USEPA AP-42 and other regional air quality regulatory agency guidance documents, should a particular equipment type not exist within the AEDT model.

Data will be obtained from the Port of Seattle on the existing fuel or run-time use of stationary sources, on an annual basis, which will be projected for 2032 and 2037 for the No Action scenario based on projected increases of aircraft and passenger levels where applicable. Data will also be obtained from the Port of Seattle for the estimated number and type of stationary sources including anticipated heating and cooling systems and backup generators associated with the proposed new facilities that would be used for the Proposed Action scenario in 2032 and 2037.

In order to determine GHG emissions, the emission factors shown in **Table 3** will be used.

[5] The Airport Support Equipment available in MOVES3 will be used for Ground Support Equipment

Table 3 GHG Emission Factors for Stationary Sources

Fuel	CO_2	N_2O	CH_4
Natural Gas	0.05444 kg/ standard cubic foot (scf)	0.00010 g/scf	0.00103 g/scf
No. 2 Oil (Diesel)	10.21 kg/gallon	0.08 g/gallon	0.41 g/gallon

Source: US EPA, Emission Factors for Greenhouse Gas Inventories, Center for Corporate Climate Leadership, April 2022, https://www.epa.gov/system/files/documents/2022-04/ghg_emission_factors_hub.pdf

2.1.9 Motor Vehicles

GHG emissions from motor vehicles operating on on- and off-airport roadways and within select parking lots are considered Scope 3, Category 3.

2.1.9.1 Off-Airport Roadways

Motor vehicles operating on off-airport roadways include passenger cars, light duty and heavy-duty trucks, and buses. These vehicles are also referred to as Ground Access Vehicles (GAVs). The study area to be used for this analysis will be the same as that used for the surface transportation study developed for the NEPA EA. The USEPA's Motor Vehicle Emissions Simulator version 3 (MOVES3) will be used to develop the NEPA GHG emissions inventory for GAVs on roadways that may be directly affected by the Proposed Action.

The Proposed Action includes roadway changes that will offer a greater level of efficiency for GAVs than the No Action:

- Construct approximately 7,300 linear feet of new Airport roadways to access the new Second Terminal.
- New Vehicle Service Road bridge over S 188 Street.
- Elevated Busway: Construct a 6,000 linear foot elevated busway to provide a landside connection for non-secure passengers to transfer among the Main Terminal, New Second Terminal, and Rental Car Facility.
- Charter/Cruise Ground Transportation Lot: Expand the existing ground transportation lot on the north side of the existing parking garage.

The Proposed Action also includes relocation of facilities including employee parking lots and cargo facilities that may cause GAVs to travel a further distance.

Each roadway segment to be analyzed for the No Action and Proposed Action scenarios will be measured to define the distance. Data will be obtained from the Port of Seattle and WSDOT pertaining to the existing number of vehicles traveling on each roadway. Within King County, MOVES3 will be used to assign the distribution of vehicle types, fuel efficiency, etc. to the respective roadways. The Port of Seattle is preparing a surface transportation study to forecast the potential number of vehicles on future roadways included in the Proposed Action. The results of the surface transportation study will be used to determine the motor vehicle emissions for the existing, Proposed Action (2032 and 2037), and No Action (2032 and 2037) conditions.

2.1.9.2 On-Airport Roadways

Additionally, motor vehicles operate on airport roadways related to airside deliveries, which include light duty and heavy-duty trucks, and buses. Information on the number and types of airside delivery vehicles accessing the airfield through security gates will be obtained from the Port, and average trip distances on the airfield calculated. The NEPA GHG emissions inventory for mobile sources will include vehicle activity related to airside deliveries.

2.1.9.3 Parking Facilities

Additionally, motor vehicles operate on airport parking facilities, which include passenger cars, light duty and heavy-duty trucks, and buses. Only emissions for vehicles in parking facilities where it is reasonable to anticipate changes in vehicle traffic due to the Proposed Action would be estimated. The NEPA GHG emissions inventory for mobile sources will include vehicle activity related to parking facilities.

2.1.10 Electricity Consumption

GHG emissions are created as a result of the generation of electricity used in Airport buildings (e.g., Airport terminals, distribution center, bus maintenance facility, and other miscellaneous sources), airfield lighting, and provided from the Port directly to tenants.

2.1.10.1 Port of Seattle Electricity Consumption

Port of Seattle electricity consumption is a result of electricity use in Airport buildings (e.g., Airport terminals, distribution center, bus maintenance facility, and other miscellaneous sources) and the airfield lighting which are generated from offsite power plant locations. This is considered Scope 2, Category 1.

GHG emissions from the consumption of electricity are calculated by multiplying the total annual electrical consumption by the emission factor of the electricity provider. The total annual electrical consumption and the appropriate emission factors will be provided by the Port.

2.1.10.2 Tenant Electricity Consumption

Tenant electricity consumption includes electricity used by tenant facilities including electricity for charging electrified GSE. This is considered Scope 3, Category 2.

GHG emissions from the consumption of electricity are calculated by multiplying the total annual electrical consumption by the emission factor of the electricity provider. The total annual electrical consumption and the appropriate emission factors will be provided by the Port.

2.1.11 Construction

Temporary increase in GHG emissions would result from construction activities associated with the Proposed Action. GHG pollutants would be emitted by construction equipment during demolition and construction of the proposed development.[6] Construction activities associated with the Proposed Action are set to begin in 2025 and all projects being in construction by 2032. A detailed construction phasing schedule will be used to identify which projects will occur between 2025 and 2032. Potential sources of construction emissions include construction vehicles and equipment. Emissions for on-road and non-road construction equipment will be estimated separately following standard industry practices.

The USEPA's MOVES3 model will be used to identify the emission factor for each equipment type. Non-road construction equipment GHG emissions will be calculated based on the number of operating hours and the emission factors. The GHG emissions results for all equipment will be summed and provided in tabular form for each year of construction.

Emission factors for on-road construction vehicles will also be developed using MOVES3. Potential on-road construction GHG emissions will be estimated by multiplying the VMT data by the appropriate emission factors and the necessary conversion factors to present the GHG emissions in metric tons. The results will be provided in tabular form for each year of construction.

[6] Embodied carbon associated with building materials used in the construction of the Proposed Action will not be included in this analysis.

Non-Road Construction Equipment

Potential non-road construction emissions will be estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

> *Equipment Emission Rate (tons/year) = Full Throttle Emission Factor (grams/hp-hour) x size (hp) x hours per year x Load Factor x usage Factor x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

Data will be obtained from the Port of Seattle concerning each phase of construction, the duration of the phase, the tasks to be completed, and other additional information for input into the Airport Construction Emissions Inventory Tool (ACEIT) to estimate the type of construction equipment, horsepower, load factor, and operating hours for each project element and phase. The ACEIT was developed by the Airport Cooperative Research Program (ACRP) and the equipment and assumptions used in the program are drawn from ACRP Report 102, Guidance for Estimating Airport Construction Emissions. The USEPA's MOVES3 model will be used to identify the emission factor of each GHG pollutant for each equipment type. Non-road construction equipment emissions will be calculated based on the number of operating hours of equipment use and the emission factors.

The GHG emissions results for all equipment will be summed and will be provided in tabular form for each year of construction.

On-Road Construction Vehicles

Potential on-road construction emissions will be estimated using the following formula as provided in the FAA's *Aviation Emissions and Air Quality Handbook Version 3 Update 1*.

> *Emission Rate (tons/year) for on-road vehicles = Emission Factor (grams/mile) x miles per day x # of days/year x (1 pound/453.59 grams) x (1 ton/2,000 pounds)*

Emission factors for on-road construction vehicles will be developed using the MOVES3 model. For employee vehicle trips related to construction activities, the model will be run using gasoline passenger vehicles including cars and light duty pickup trucks. For material delivery and off-site haul vehicle trips, diesel combination long-haul trucks will be assumed in order to estimate maximum potential emissions.

Total vehicle miles traveled (VMT) for vehicles operating during each Proposed Action element and for each type of on-road construction activity during each construction year will be estimated. This includes construction employee vehicle trips to and from the job site using model default distances. The analysis will also include material delivery trips and off-site hauling trips using heavy duty trucks using model default distances. Potential on-road construction emissions will be estimated by multiplying the VMT data by the appropriate emission factors and the necessary conversion factors to present the GHG emissions in tons. The results will be provided in tabular form for each year of construction.

2.2 Conduct Qualitative Climate Evaluation (NEPA)

Per CEQ and FAA guidance, the NEPA EA will include a discussion on the level of preparedness with respect to the impacts of climate change and a discussion of the extent to which the Proposed Action and any identified alternatives could be affected by future climate conditions.

2.2.1 Level of Preparedness

FAA 1050.1F Desk Reference states that the affected environment should discuss the current level of preparedness in the study area with respect to the impacts of climate change. This involves describing current

measures in place within the study area to adapt to the impacts of climate change.[7] As such, the following items will be qualitatively discussed in the NEPA EA.

1. Review the Port sustainability initiatives, opportunities, and actions to aid with achieving climate adaptation in its SAMP Planning Technical Memorandum.8
2. Identify additional GHG reduction programs which the Port may implement independent of the Proposed Action. This would include, for example, a qualitative discussion of the implementation of SAF consumption at the Airport, further electrification of GSE, and the usage of renewable natural gas for future boilers.
3. Discussion of the Port's vulnerability assessment that identifies the existing and future vulnerabilities of the Airport related to climate change.

2.2.2 Climate Adaptation

The NEPA EA will include a discussion of the extent to which the Proposed Action and any identified alternatives could be affected by future climate conditions. This discussion will include the following items:

1. Identify potential long-term effects of climate on the Airport's infrastructure, based on the Port's vulnerability assessment.
2. Search for other climate change assessments in the local area to discuss potential climate change impacts that may occur in the short term (through 2037) and beyond. This includes outreach to state agencies, city government and local universities for existing studies. One piece will include a review of the most recent State of Knowledge reports from the University of Washington's Climate Impacts Research Group.
3. Review National Climate Assessment (NCA)9 section for the region for a high-level overview of key messages related to expected climate changes and their impacts in the region that may occur in the short term (through 2037) and beyond. For example, the Northwest may be susceptible to changes in relative amounts and timing of snow and rainfall which can post threats to reliable hydropower production.
4. Review existing climate action plans and goals, as available, for the county and state, and how the Proposed Action and any identified alternatives will meet or retract from achieving these goals.
5. Conduct a desktop review to identify and discuss additional climate action plans and goals of stakeholders at SEA, including but not limited to, the FAA's Aviation Climate Action Plan, and that of the airlines operating at SEA, where available.
6. Use the ACRP Airport Climate Risk Operational Screening Tool to conduct a screening level assessment that identifies potential long-term climate risks, including:
   - Potential changes in climate in various periods based on specific climate vectors (e.g. higher temperatures, increased storm frequency, etc.) in years 2040 and 2070.
   - Impacts to airport infrastructure and operations.

In addition, this discussion will also include any considerations for the Proposed Action to adapt to forecasted climate change conditions.

Note, the NEPA EA will evaluate the potential climate impacts on the local environmental justice communities (areas where minority and low-income populations represent a higher fraction of the population compared with the general population) independent of the climate assessment. As such, an environmental justice impact analysis will not be included in the climate assessment.

3 Protocol for Cumulative GHG Impact Analysis (NEPA)

The Council on Environmental Quality (CEQ) Regulations define a cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (see 40 CFR § 1508.7).

The analysis of cumulative impacts recognizes that while the impacts of individual actions may be small, when combined with the impacts of past, present, and reasonably foreseeable future actions on populations or resources in and around SEA, the impacts could be potentially significant.

Pursuant to FAA guidance, past, present, and reasonably foreseeable future actions must be considered in determining whether there are potential cumulative impacts. Based on the guidance from 1050.1F Desk Reference, "[t]he significance of cumulative impacts should be determined in the same manner as the significance of direct and indirect impacts." FAA Order 1050.1F uses the same threshold of significance for project significant impacts as it does for cumulative impacts.

3.1 Review the List of Past, Present, and Reasonably Foreseeable Future Projects

Past Projects

CEQ NEPA regulations require analysis of past actions to the extent they are relevant and useful in analyzing whether the reasonably foreseeable effects of the current action combined with the past action would create cumulative effects. It is important to note that according to the CEQ's memorandum, *Guidance on the Consideration of Past Actions in Cumulative Effects Analysis*, focus should be on whether the information from past projects is "relevant to reasonably foreseeable significant adverse impacts," is "essential to a reasoned choice among alternatives," and can be obtained without exorbitant cost. Furthermore, present impacts of past actions that are relevant and useful are those that may have a significant cause-and-effect relationship with the direct and indirect impacts of the proposed action and alternative(s). Only information that is useful to decision-makers and the public should be included, and the CEQ warns against including extraneous background data.

For this analysis, past projects are defined as those which occurred within the past seven years (between 2015 and 2022). This timeframe goes back far enough to provide a reasonable historical context about the current state of the resource.[10]

Present Projects

Present projects are any actions occurring within the same study area as the existing conditions for the Proposed Action.

Reasonably Foreseeable Future Projects

Reasonably foreseeable future projects are defined as actions that are likely to be completed within the time period from 2022 through 2032 and that have been developed with enough specificity to provide meaningful data

[10] The FAA has discretion to determine whether, and to what extent, information about the specific nature, design, or present impacts of a past action are useful for the analysis of the impacts of the proposed action and alternative(s).

for analysis. No projects past 2032 are included because there is a lack of adequate detail about those later projects to enable meaningful review; any analysis of those projects or their impacts would be speculative.

3.2 Identify Climate Impacts of the Proposed Action

A review will be conducted of the climate analyses that have been undertaken for the cumulative projects identified (past, present, and reasonably foreseeable future projects). A qualitative evaluation of the climate cumulative impacts with consideration of the cumulative projects' will be developed.

Note, the NEPA EA will evaluate the potential climate impacts on environmental justice communities (areas where minority and low-income populations represent a higher fraction of the population compared with the general population) independent of the climate assessment. As such, an environmental justice impact analysis will not be included in the climate assessment.

Subject: SEA SAMP NTP EA NEPA AQ Protocol

Good morning everyone,

Thank you again for taking the time yesterday to discuss the AQ Protocol. Attached is the updated AQ Protocol for the NTP NEPA EA. Changes were made utilizing track changes to make it easier for you to track. Included below are the links to the resource materials the FAA agreed to provide. Please let me know if you would prefer attachments instead of links.

We would greatly appreciate any comments or concurrence with the Air Quality Protocol by Friday July 28.

Thanks so much
Kandice

Subject: RE: [EXTERNAL] RE: Sea-Tac Int'l Airport: Sustainable Airport Master Plan Near-Term Projects Environmental Review - Climate Assessment Protocol - PLEASE REVIEW

Good morning Eric,

I realized after I received you email that some of our responses were not included with the submittal of the revised Climate Assessment Protocol. The following were the responses for the comments that did not result in changes to the Protocol:

- **PSCAA Comment:** Black carbon, as a pollutant category, also has a significant CO2e for many sources. This discussion suggests that it's not included, is that correct, if so, why?
    - **FAA Response:** While black carbon aerosols play a role in climate impacts, the contribution of black carbon to current climate change remains highly uncertain. The FAA is currently studying how to measure and predict non-volatile particulate matter emissions (a.k.a. soot or black carbon) from sustainable and conventional aviation fuels. The EA will likely include a qualitative discussion on how advances in engine combustion designs are yielding reductions in emissions of non-volatile particulate matter.
- **PSCAA Comment:** So, this implies that APUs use Jet-A? Is this correct? Naively, I find this surprising as most other types of generators don't use Jet-A, and I'd think other fuels would be cheaper.
    - **FAA Response:** APUs are engine-driven generators contained in the aircraft (usually in the tail) that provide the aircraft with necessary energy during the time the aircraft is at the gate. Part of the generated energy is used for air conditioning. As an alternative, the required energy can be supplied by ground-based equipment that delivers electrical power at 400 Hz and preconditioned air to the aircraft. The use of fuel dispensed metric will capture APU usage and therefore APUs will be removed as a separate source. Port owned ground power units (GPUs) and preconditioned air units (PCAs) will be captured under Ground Support Equipment.
- **PSCAA Comment:** GSE electrification is a known GHG reduction pathway, and so the (lack of) infrastructure could be a key limiting (non)Action. Not clear this is in the proposed Action or Alternative, but it could be. It's quantifiable and should be discussed. Directly its Scope 3, but it actually seems like a Scope1-Scope 3 split incentive/responsibility problem. A plausible

alternative could include full electrification of GSE. So this section would need mention of a model or calculation method for electric GSE.
    - **FAA Respon**se: The Port has installed over 400 charging points/stations for electric ground support equipment (eGSE) throughout the Airport across all terminals. While there is no requirement by the Port for airlines to utilize eGSE, several airlines have opted to utilize eGSE. The eGSE will be captured in the GSE survey and accounted for in the AEDT modeling for the existing conditions. Since there are no requirements for the implementation of additional electric GSE in the future by the Port or by the Proposed Action, any additional use of eGSE in the future than what is accounted for in the existing conditions would be speculative for both the No Action and Proposed Action. As such, no further alternatives, such as those including full electrification of GSE, as recommended for the purpose of this analysis.
- **PSCAA Comment:** The proposed Action includes SAF tanks and infrastructure, correct? So, there should be some semi-quantitative discussion (relative emission factor * fuel volume) of the potential GHG reduction that would be enabled. And, that the enabled (potential) SAF fuel volume is in excess (it is?) of the projected demand/use, such that the proposed tanks aren't the limiting factor (and thus GHG emission causing).
    - **FAA Response:** While SAF tanks and infrastructure are included in the Proposed Action, there is no requirement for the Port or tenants to utilize SAF. In addition, there are supply chain issues with obtaining SAF and isn't clear when these issues will be resolved. As such, any use of SAF in the future would be speculative for both the No Action and Proposed Action. As such, no quantitative discussion is recommended for the purpose of this analysis. Qualitative discussions on the FAA's CLEEN program and the Port's sustainable fuel goals and how they could reduce future emissions will be included--see Section 2.2.
- **PSCAA Comment:** Are these then all "Full Throttle" emission factors, when most of the use isn't at "full throttle"? The issue being that the fuel-use/hp-hour (fuel efficiency) is probably fairly different across the range of "throttle settings". Same note applies to all the full throttle references above
    - **FAA Response:** Yes--the use of the "full throttle emission factor" is based on FAA guidance.

I hope these responses help explain why changes were or were not made in the Protocol. Please let me know if you have any questions or comments.

Thanks so much for the follow up and edits.

I do have one more comment regarding the black carbon estimates that we provided earlier that do not seem included in the revisions.

As black carbon is one of the largest positive contributors to radiative forcing to the atmosphere (https://www.ipcc.ch/apps/njlite/ar5wg2/njlite_download2.php?id=9465#page=72), we request that you revisit including estimated black carbon emissions through available data from model outputs. Although you likely won't be able to put emissions in equivalent CO_2 units, cataloguing the emissions would help track the potential impact in different modeled scenarios. From the MOVES model output, we would request including elemental carbon be reported. And from the AEDT model, we request the non-volatile particulate matter be reported.

We appreciate you again for all of your time and energy in this process, Erik Saganić

Hi Erik,

Attached is an updated Climate Assessment Protocol that we've updated with the Federal Aviation Administration (I have also included your original comments). We believe it addresses all of the Puget Sound Clear Air Agency's (PSCAA) comments.

I am looking for the PSCAA's concurrence on this protocol by Friday, October 20, 2023.

Please let Kandice or I know if you have any questions.

We have also just started the modeling of the Proposed Action (i.e. future conditions with projects) and will reach out when we have initial results later this Fall.

Thank you,

Steve Rybolt

Subject: Sea-Tac Int'l Airport: Sustainable Airport Master Plan Near-Term Projects Environmental Review - Climate Assessment Protocol - PLEASE REVIEW

Hi Erik,

Thanks to you and the PSCAA Team for reviewing our NEPA Air Quality Protocol. We have begun our analyses and once we have initial data, we will be sharing that with you to determine if dispersion modeling may be warranted to support the analysis.

As we identified in the NEPA Air Quality Protocol, we have drafted a separate Climate Assessment Protocol.

Attached you will find the NEPA Climate Assessment Protocol. We are seeking any comments to the document no later than August 11, 2023.

I'm happy to set up a time to discuss and if you need more time, please let us know.

Please let Kandice or I know if you have any questions.

Thank you,

Steve Rybolt

An official website of the United States government

NAAQS Table

The Clean Air Act <https://epa.gov/clean-air-act-overview>, which was last amended in 1990, requires EPA to set National Ambient Air Quality Standards (40 CFR part 50) for six principal pollutants ("criteria" air pollutants <https://epa.gov/criteria-air-pollutants>) which can be harmful to public health and the environment. The Clean Air Act identifies two types of national ambient air quality standards. ***Primary standards*** provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly. ***Secondary standards*** provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

Periodically, the standards are reviewed and sometimes may be revised, establishing new standards. The most recently established standards are listed below. In some areas of the U.S., certain regulatory requirements may also remain for implementation of previously established standards <https://epa.gov/ground-level-ozone-pollution/ozone-implementation-regulatory-actions>.

Units of measure for the standards are parts per million (ppm) by volume, parts per billion (ppb) by volume, and micrograms per cubic meter of air ($\mu g/m^3$).

Pollutant [links to historical tables of NAAQS reviews]	**Primary/ Secondary**	**Averaging Time**	**Level**	**Form**
Carbon Monoxide (CO) <https://epa.gov/co-pollution/timeline-carbon-monoxide-co-national-ambient-air-quality-standards-naaqs>	primary	8 hours	9 ppm	Not to be exceeded more than once per year
		1 hour	35 ppm	

Pollutant [links to historical tables of NAAQS reviews]	**Primary/ Secondary**	**Averaging Time**	**Level**	**Form**
Lead (Pb) <https://epa.gov/lead-air-pollution/timeline-lead-pb-national-ambient-air-quality-standards-naaqs>	primary and secondary	Rolling 3 month average	0.15 µg/m^3 (1)	Not to be exceeded
Nitrogen Dioxide (NO_2) <https://epa.gov/no2-pollution/timeline-nitrogen-dioxide-no2-national-ambient-air-quality-standards-naaqs>	primary	1 hour	100 ppb	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
	primary and secondary	1 year	53 ppb (2)	Annual Mean
Ozone (O_3) <https://epa.gov/ground-level-ozone-pollution/timeline-ozone-national-ambient-air-quality-standards-naaqs>	primary and secondary	8 hours	0.070 ppm (3)	Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years

Pollutant [links to historical tables of NAAQS reviews]		**Primary/ Secondary**	**Averaging Time**	**Level**	**Form**
Particle Pollution (PM) <https://epa.gov/pm-pollution/timeline-particulate-matter-pm-national-ambient-air-quality-standards-naaqs>	$PM_{2.5}$	primary	1 year	9.0 µg/m^3	annual mean, averaged over 3 years
		secondary	1 year	15.0 µg/m^3	annual mean, averaged over 3 years
		primary and secondary	24 hours	35 µg/m^3	98th percentile, averaged over 3 years
	PM_{10}	primary and secondary	24 hours	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide (SO_2) <https://epa.gov/so2-pollution/timeline-sulfur-dioxide-national-ambient-air-quality-standards-naaqs>		primary	1 hour	75 ppb (4)	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
		secondary	3 hours	0.5 ppm	Not to be exceeded more than once per year

(1) In areas designated nonattainment for the Pb standards prior to the promulgation of the current (2008) standards, and for which implementation plans to attain or maintain the current (2008) standards have not been submitted and approved, the previous standards (1.5 µg/m3 as a calendar quarter average) also remain in effect.

(2) The level of the annual NO_2 standard is 0.053 ppm. It is shown here in terms of ppb for the purposes of clearer comparison to the 1-hour standard level.

(3) Final rule signed October 1, 2015, and effective December 28, 2015. The previous (2008) O_3 standards are not revoked and remain in effect for designated areas. Additionally, some areas may have certain continuing implementation obligations under the prior revoked 1-hour (1979) and 8-hour (1997) O_3 standards.

(4) The previous SO_2 standards (0.14 ppm 24-hour and 0.03 ppm annual) will additionally remain in effect in certain areas: (1) any area for which it is not yet 1 year since the effective date of designation under the current (2010) standards, and (2)any area for which an implementation plan providing for attainment of the current (2010) standard has not been submitted and approved and which is designated nonattainment under the previous SO_2 standards or is not meeting the requirements of a SIP call under the previous SO_2 standards (40 CFR 50.4(3)). A SIP call is an EPA action requiring a state to resubmit all or part of its State Implementation Plan to demonstrate attainment of the required NAAQS.

Menu of Control Measures for NAAQS Implementation

The Menu of Control Measures (MCM) provides state, local and tribal air agencies with the existing emission reduction measures as well as relevant information concerning the efficiency and cost effectiveness of the measures. State, local and tribal agencies will be able to use this information in developing emission reduction strategies, plans and programs to assure they attain and maintain the National Ambient Air Quality Standards (NAAQS). The MCM is a living document that can be updated with newly available or more current data as it becomes available.

You don't often get email from kandice.krull@faa.gov. Learn why this is important

Thanks for the quick response Erik. We really appreciate all of your help with this project.

We will share the entire air quality analysis, including the climate analysis, once it is completed.

Happy holidays

Kandice

Subject: RE: Sea-Tac International Airport Preliminary Air Results

Thanks Kandice,

I have no further comments on the table below. I would not expect these numbers to result in an exceedance of the NAAQS.

Erik

Subject: Sea-Tac International Airport Preliminary Air Results

Hi Eric,

We have preliminary results from the air quality analysis for the SEA SAMP NTP EA ready for PSCAA review. We are hoping to get input from the PSCAA on the potential for the project to cause an exceedance of the NAAQS within the region. We are more than willing to have a call to discuss the results and get feedback if that would be easier.

We are requesting a response by Friday January 12, 2024.

Thanks so much,

Kandice

Subject: SEA SAMP - Preliminary AQ Operational Emissions Inventories

Hey Sarah,

See below for the SEA SAMP preliminary air quality operational emissions inventories for 2032 and 2037. Let me know if you need anything else.

Table 1: 2032 No Action and 2032 Proposed Action Operational Emissions Inventory

	Annual Emissions (tons per year)					
	CO	VOC	NOx	SOx	PM 10	PM 2·5

2032 No Action

Aircraft	2,587	282	2,857	259	28	28
GSE	314	11	22	0	2	2
Stationary Sources	19	12	34	1	1	1
Motor Vehicles	1,916	15	176	2	3	3
2032 No Action Subtotal	*4,837*	*320*	*3,089*	*263*	*35*	*35*

2032 Proposed Action

Aircraft	2,603	284	2,904	262	29	29
GSE	320	12	23	0	3	2
Stationary Sources	26	16	47	2	2	2
Motor Vehicles	1,961	15	179	3	3	3
2032 Proposed Action Subtotal	*4,910*	*327*	*3,153*	*267*	*37*	*36*
2032 Net Emissions	***73***	***7***	***64***	***4***	***1***	***1***

Table 2: 2037 No Action and 2037 Proposed Action Operational Emissions Inventory

	Annual Emissions (tons per year)					
	CO	VOC	NOx	SOx	PM 10	PM 2·5

2037 No Action

Aircraft	2,511	267	3,076	266	30	30
GSE	320	12	22	0	3	2
Stationary Sources	19	12	34	1	1	1
Motor Vehicles	1,620	12	160	3	2	2
2037 No Action Subtotal	*4,470*	*302*	*3,292*	*270*	*36*	*36*

2037 Proposed Action

Aircraft	2,819	292	3,324	293	32	32
GSE	343	12	24	0	3	2
Stationary Sources	26	16	47	2	2	2
Motor Vehicles	1,720	12	168	3	2	2
2037 Proposed Action Subtotal	*4,908*	*333*	*3,564*	*298*	*39*	*39*
2037 Net Emissions	***438***	***31***	***272***	***27***	***3***	***3***

Source: EPA eGRID2020, February 2022

Note: Total output emission factors can be used as default factors for estimating GHG emissions from electricity use when developing a carbon footprint or emissions inventory. Annual non-baseload output emission factors should not be used for those purposes, but can be used to estimate GHG emissions reductions from reductions in electricity use.

Table 7 Steam and Heat

	CO_2 Factor (kg / mmBtu)	CH_4 Factor (g / mmBtu)	N_2O Factor (g / mmBtu)
Steam and Heat	66.33	1.250	0.125

Note: Emission factors are per mmBtu of steam or heat purchased. These factors assume natural gas fuel is used to generate steam or heat at 80 percent thermal efficiency.

Scope 3 Emission Factors

Scope 3 emission factors provided below are aligned with the Greenhouse Gas Protocol Technical Guidance for Calculating Scope 3 Emissions, version 1.0 (Scope 3 Calculation Guidance). Where applicable, the specific calculation method is referenced. Refer to the Scope 3 Calculation Guidance for more information (http://www.ghgprotocol.org/scope-3-technical-calculation-guidance).

Table 8 Scope 3 Category 4: Upstream Transportation and Distribution and Category 9: Downstream Transportation and Distribution

These factors are intended for use in the distance-based method defined in the Scope 3 Calculation Guidance. If fuel data are available, then the fuel-based method should be used, with factors from Tables 2 through 5.

Vehicle Type	CO_2 Factor (kg / unit)	CH_4 Factor (g / unit)	N_2O Factor (g / unit)	Units
Medium- and Heavy-Duty Truck	1.450	0.013	0.034	vehicle-mile
Passenger Car [A]	0.332	0.007	0.007	vehicle-mile
Light-Duty Truck [B]	0.454	0.012	0.009	vehicle-mile
Medium- and Heavy-Duty Truck	0.211	0.0020	0.0049	ton-mile
Rail	0.022	0.0017	0.0006	ton-mile
Waterborne Craft	0.041	0.0183	0.0008	ton-mile
Aircraft[C]	1.165	-	0.0359	ton-mile

Source:
CO_2, CH_4, and N_2O emissions data for road vehicles are from Table 2-13 of the EPA (2021) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019.
Vehicle-miles and passenger-miles data for road vehicles are from Table VM-1 of the Federal Highway Administration Highway Statistics 2019.
CO_2e emissions data for non-road vehicles are based on Table A-107 of the EPA (2021) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019, which are distributed into CO_2, CH_4, and N_2O emissions based on fuel/vehicle emission factors.
Freight ton-mile data are from Table 1-50 of the Bureau of Transportation Statistics, National Transportation Statistics for 2021 (Data based on 2019 for rail, waterborne craft and aircraft; medium- and heavy-duty truck based on 2018, due to data availability).

Notes:
Vehicle-mile factors are appropriate to use when the entire vehicle is dedicated to transporting the reporting company's product. Ton-mile factors are appropriate when the vehicle is shared with products from other companies.
[A] Passenger car: includes passenger cars, minivans, SUVs, and small pickup trucks (vehicles with wheelbase less than 121 inches).
[B] Light-duty truck: includes full-size pickup trucks, full-size vans, and extended-length SUVs (vehicles with wheelbase greater than 121 inches).
[C] Medium- and Heavy-Duty Truck: includes Combination Trucks and single frame trucks that have 2-Axles and at least 6 tires or a gross vehicle weight rating exceeding 10,000 lbs.

Table 9 Scope 3 Category 5: Waste Generated in Operations and Category 12: End-of-Life Treatment of Sold Products

These factors are intended for use in the waste-type-specific method or the average-data method defined in the Scope 3 Calculation Guidance for category 5 and category 12. Choose the appropriate material and disposal method from the table below. For the average-data method, use one of the mixed material types, such as mixed MSW.

Source: EPA, Office of Resource Conservation and Recovery (February 2016) Documentation for Greenhouse Gas Emission and Energy Factors used in the Waste Reduction Model (WARM). Factors from tables provided in the Management Practices Chapters and Background Chapters. WARM Version 15, November 2020 Update. Additional data provided by EPA, WARM-15 Background Data.

Notes: These factors do not include any avoided emissions impact from any of the disposal methods. All the factors presented here include transportation emissions, which are optional in the Scope 3 Calculation Guidance, with an assumed average distance traveled to the processing facility. AR4 GWPs are used to convert all waste emission factors into CO_2e.

[A] Recycling emissions include transport to recycling facility and sorting of recycled materials at material recovery facility.
[B] Landfilling emissions include transport to landfill, equipment use at landfill and fugitive landfill CH_4 emissions. Landfill CH_4 is based on typical landfill gas collection practices and average landfill moisture conditions.
[C] Combustion emissions include transport to combustion facility and combustion-related non-biogenic CO_2 and N_2O
[D] Composting emissions include transport to composting facility, equipment use at composting facility and CH_4 and N_2O emissions during composting.

Table 10 Scope 3 Category 6: Business Travel and Category 7: Employee Commuting

These factors are intended for use in the distance-based method defined in the Scope 3 Calculation Guidance. If fuel data are available, then the fuel-based method should be used, with factors from Tables 2 through 5.

Vehicle Type	CO_2 Factor (kg / unit)	CH_4 Factor (g / unit)	N_2O Factor (g / unit)	Units

CO_2, CH_4, and N_2O emissions data for highway vehicles are from Table 2-13 of the EPA (2021) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2019.
Vehicle-miles and passenger-miles data for highway vehicles are from Table VM-1 of the Federal Highway Administration Highway Statistics 2019.
Fuel consumption data and passenger-miles data for rail are from Tables A.14 to A.16 and C.9 to C.11 of the Transportation Energy Data Book: Edition 39. Fuel consumption was converted to emissions by using fuel and electricity emission factors presented in the tables above.
Intercity Rail factors from communication with Amtrak (Laura Fotiou), March 2020. These are based on 2019 values.
Air Travel factors from 2021 Guidelines to Defra / DECC's GHG Conversion Factors for Company Reporting. Version 1.0 June 2021.

Notes:
[A] Passenger car: includes passenger cars, minivans, SUVs, and small pickup trucks (vehicles with wheelbase less than 121 inches).
[B] Light-duty truck: includes full-size pickup trucks, full-size vans, and extended-length SUVs (vehicles with wheelbase greater than 121 inches).
[C] Intercity rail: Amtrak long-distance rail between major cities. Northeast Corridor extends from Boston to Washington D.C. Other Routes are all routes outside the Northeast Corridor.
[D] Commuter rail: rail service between a central city and adjacent suburbs (also called regional rail or suburban rail).
[E] Transit rail: rail typically within an urban center, such as subways, elevated railways, metropolitan railways (metro), streetcars, trolley cars, and tramways.

100-year GWPs from IPCC Fourth Assessment Report (AR4), 2007. IPCC AR4 was published in 2007 and is among the most current and comprehensive peer-reviewed assessments of climate change. AR4 provides revised GWPs of several GHGs relative to the values provided in previous assessment reports, following advances in scientific knowledge on the radiative efficiencies and atmospheric lifetimes of these GHGs and of CO_2. Because the GWPs provided in AR4 reflect an improved scientific understanding of the radiative effects of these gases in the atmosphere, the values provided are more appropriate for supporting the overall goal of organizational GHG reporting than the Second Assessment Report (SAR) GWP values previously used in the Emission Factors Hub.
While EPA recognizes that Fifth Assessment Report (AR5) GWPs have been published, in an effort to ensure consistency and comparability of GHG data between EPA's voluntary and non-voluntary GHG reporting programs (e.g. GHG Reporting Program and National Inventory), EPA recommends the use of AR4 GWPs. The United States and other developed countries to the UNFCCC have agreed to submit annual inventories in 2015 and future years to the UNFCCC using GWP values from AR4, which will replace the current use of SAR GWP values. Utilizing AR4 GWPs improves EPA's ability to analyze corporate, national, and sub-national GHG data consistently, enhances communication of GHG information between programs, and gives outside stakeholders a consistent, predictable set of GWPs to avoid confusion and additional burden.

1.0 Introduction

CDM Smith completed this Air Quality and Human Health Risk Assessment (HHRA) technical document to support the environmental review under Washington State Environmental Policy Act (SEPA) for the Seattle-Tacoma International Airport (SEA) Sustainable Airport Master Plan (SAMP) Near-Term Projects (NTPs). The U.S. Department of Transportation, Federal Aviation Administration (FAA) approved the SEA SAMP NTPs as described in the Final Environmental Assessment (EA) on September 24, 2025.

1.1 Project Background

The Port of Seattle owns and operates SEA. In 2015, the Port of Seattle launched the SAMP to create a Long-Term Vision (LTV) aimed at accommodating future passenger growth and addressing the evolving needs of SEA over a 20-year planning period, extending through 2034.

One of the primary goals identified in the SAMP was to enhance the overall passenger experience at SEA. Current passenger processing function, including on-site parking, the check-in hall, security screening areas, holdrooms, and the number of available gates, were found to be insufficient or undersized for the airport's current and projected passenger volumes. These limitations result in crowded conditions, extended wait times, and flight delays. As passenger demand continues to grow, these challenges are expected to intensify.

The SAMP's analysis ultimately indicated that, even with the implementation of the LTV, unconstrained demand over the 20-year horizon would lead to significant airfield congestion and delays. These issues are attributed primarily to constraints within the airfield and airspace system. Both the Port of Seattle and the FAA concluded that resolving these long-term airfield and airspace limitations would require a more comprehensive planning effort, separate from the SAMP. As such, they determined that a dedicated airfield and airspace planning study was necessary to assess whether additional actions are warranted before the LTV can be fully realized. Consequently, the FAA determined that the LTV was not yet ready for environmental review.

To address more immediate operational needs, the Port of Seattle developed the NTPs. These NTPs comprise 31 individual projects designed to enhance the efficiency and safety of SEA, improve airport access, and provide better support facilities for both airlines and airport operations. Because the NTPs address near-term objectives and are distinct from the broader goals of the LTV, they are considered independent initiatives. The FAA determined that these NTPs were sufficiently defined and ready to proceed to environmental review. The NTPs collectively constitute the Proposed Action.

1.2 Project Location

SEA is an approximately 2,800-acre commercial airport in SeaTac, Washington, approximately 12 miles south of downtown Seattle and 20 miles north of the City of Tacoma. SEA is generally bounded by State Route (SR) 99 to the east, SR 509 to the west, South 142nd Place to the north, and South 200th Street to the south. Additional land owned by the Port and used for runway protection and noise compatibility extends northward to South 136th Street and southward to South 216th Street.

Cities nearest to SEA include Burien, Des Moines, Normandy Park, SeaTac, and Tukwila, as well as portions of unincorporated King County. Other nearby cities include Federal Way, Kent, and Seattle. The predominant land use nearest to SEA is residential, with local commercial and some industrial areas. Land uses directly adjacent to SEA property include park land, residential, industrial, and commercial. **Figure 1.1** shows SEA and the general pattern of nearby development.

Figure 1.1 Location of Near-Term Projects

1.3 Proposed Action

In addition to construction and operation of the NTPs, the Proposed Action also includes the construction and operation of associated program support projects, operational infrastructure improvements, and stormwater drainage system and industrial wastewater system improvements necessary for the implementation of the NTPs. The Proposed Action includes the following NTPs (**Figure 1.2**):

- A01 – Extension of parallel Taxiways A and B by approximately 1800 feet
- A02 – Construction of Runway 16R/34L blast pads
- A03 – Taxiway C/D reconfiguration and Runway Incursion Mitigation (RIM)
- A04 – Relocation of a portion of Taxiway B to meet standards
- A05 – Construction of a north holding pad (approximately 90,000 square feet)
- A06 – Construction of a new high-speed exit for Runway 34L arrivals between Taxiways J and E
- A07 – Taxiway D extension of approximately 500 from Runway 16C/34C west to Taxiway T
- A08 – North cargo hardstand construction (approximately 360,000 square feet)
- A09 – Construction of a central hardstand (approximately 292,000 square feet)
- A10 – Taxiway fillets construction
- T01 – Construction of a multilevel terminal concourse and aircraft apron (up to 19 gates)
- T02 – Construction of an additional multilevel passenger terminal and parking garage
- C01 – Cargo 4 warehouse construction to replace Cargo 6 warehouse demolished for T01
- C02 – Construction of a cargo warehouse north of SR 518
- C03 – Cargo warehouse construction north of SR 518
- L01 – Relocation of North Airport Expressway southbound lanes for the construction of A09 and T01
- L02 – Elevated busway and stations at the Main Terminal, Second Terminal, and Rental Car Facility
- L03 – Construction of a loop ramp and split-level curbsides for the Second Terminal
- L04 – Northeast ground transportation center construction on north side of existing parking garage
- L05 – Relocation of the ground transportation holding lot displaced by L02 north of SR 518
- L07 – Construction of employee parking garage north of SR 518
- S01 – Fuel farm expansion (four new settling tanks and one blending tank)
- S02 – Relocation of aircraft rescue and firefighting (ARFF) facility for construction of T01
- S03 – Construction of secondary ARFF facility

- S04 – Relocation of the fuel rack from Cargo 6 to Cargo 3 for construction of T01
- S05 – Triculator relocation to north cargo area for construction of A09
- S06 – Relocation of deicing tanks to a northern and southern location
- S07 – Construction of westside maintenance campus
- S08 – Airline support building construction in north cargo for construction of T01 and A08
- S09 – Expansion of the AMB/AFCO III building to replace displaced airline support facilities
- S10 – Construction of centralized receiving and distribution center north of SR 518
- Expansion of stormwater/industrial wastewater infrastructure
- Construction of stormwater management facilities and storm drainage vaults
- Installation of utilities (sewer, water, natural gas, fuel, and information technology)
- Central mechanical plant upgrades

Figure 1.2 Proposed Action

1.4 Scope of Analysis

The air quality impact analysis characterizes the affected environment, identifies and quantifies emission sources, and evaluates the dispersion of emissions, cumulative with background concentrations, within the extents of the Proposed Action's meaningful air quality influence to determine the likelihood of significant adverse impacts, such as an exceedance of an applicable air

quality or HHRA threshold. The analysis evaluates several scenarios across multiple years to comprehensively assess the effects of the Proposed Action on air quality and human health. The primary scenarios analyzed include both the construction and operation periods for two alternatives: (i) the Proposed Action and (ii) the No Action Alternative.

For the construction period, the analysis considers all years from 2025 through 2032 to capture the full anticipated eight-year timeline of construction activities. The operational, or future forecast, analysis focuses on two key time frames: the first year following final project buildout (2032) and five years after buildout (2037). This approach enables both immediate and longer-term operational impacts to be assessed.

Generally, there are no specific air quality or human health regulations established solely for SEPA review regarding mobile source emissions. SEPA requires disclosing and evaluating likely significant adverse environmental impacts of proposed actions, but it does not set independent emission limits, concentration standards, or health-based thresholds for mobile sources. As a result, environmental analyses relies on existing regulatory standards, health-based screening levels, and risk benchmarks from other regulatory programs as practical substitutes for assessing significance.

For this SEPA analysis, established air quality standards, acceptable source impact levels (ASILs), screening thresholds, and risk benchmarks serve as reliable proxies to evaluate potential air quality and human health impacts associated with the Proposed Action. Although these thresholds were originally designed for regulatory purposes such as Clean Air Act compliance, air permitting, or toxic air pollutant control, they are commonly used in environmental reviews to provide a consistent, protective, and technically sound framework for determining significance. Using these benchmarks enables evaluation of potential impacts transparently, conservatively, and according to accepted scientific and regulatory practices, while remaining appropriate for SEPA's disclosure-based focus instead of regulatory compliance.

With respect to criteria pollutants, modeled project-related concentrations (including cumulative effects with representative background) are compared against the National Ambient Air Quality Standards (NAAQS), outlined in Section 2.1.5 (Benchmarks) and Table 2.4. For toxic air pollutants and human health evaluations, screening and decision benchmarks are explained in Section 2.1.5.2 and Table 2.5, and applied within HHRA methods and interpretation described in **Section 3.0** (including the discussion on hazard index and cancer risk thresholds). These comparisons collectively help determine whether predicted impacts are likely to be significant under SEPA.

Using these benchmarks offers a well-established and health-protective means of measuring potential impacts and presenting results in a way that aligns with other air quality and health analyses. When benchmarks are based on screening, they are applied conservatively to prioritize quantitative evaluation on pollutants most likely to affect health outcomes, in keeping with the tiered evaluation framework detailed later in this report.

1.4.1 Construction

The construction analysis identifies and quantifies construction-related emissions sources for each year of construction, which was analyzed over eight years, between 2025 and 2032, in the Final EA. While the

actual construction dates are currently unknown, these years were retained in this analysis because they provide a conservative assessment of potential impacts. Exhaust emissions from construction equipment tend to decrease in future years because of equipment turnover and improvements in engine technology; therefore, by retaining the original assessment years, emissions would not be unintentionally reduced by adjusting the analysis to different years. The annual construction emission inventories developed in the Proposed Action's Final EA, conducted pursuant to the National Environmental Policy Act (NEPA), were used for this analysis. Concentrations were estimated using dispersion modeling of the annual construction emissions inventories for the identified sources for each pollutant over the project schedule.

1.4.2 Operations

Operational emissions were quantified for first year after final project buildout (2032) and five years after buildout (2037). The annual emission inventories developed in the Proposed Action's Final EA were used in this analysis for certain sources; however, the aircraft study was upgraded to the most current version of the FAA's Aviation Environmental Design Tool (AEDT), available at the time of the analysis, version 3g. Dispersion modeling of Proposed Action–related operational emissions was then completed.

2.0 Air Quality

2.1 Methodology

2.1.1 Criteria Pollutants

Six criteria pollutants, defined in the U.S. Environmental Protection Agency's (EPA's) Title 40, Code of Federal Regulations, Part 50 implementing regulations for the Clean Air Act (CAA), were evaluated for the Proposed Action's construction and operational activities. These pollutants include:

- Carbon monoxide (CO)
- Nitrogen dioxide (NO_2)
- Particulate Matter
  - With diameter less than or equal to 10 micrometers (PM_{10})
  - With diameter less than or equal to 2.5 micrometers ($PM_{2.5}$)
- Sulfur dioxide (SO_2)
- Lead (Pb)

Ozone (O_3), while also being a criteria pollutant, was not individually modeled because it is a secondary pollutant that is not emitted directly from sources associated with the Proposed Action.[1] The following subsections provide information regarding the health effects of the six criteria pollutants that were evaluated in the air quality analysis.

2.1.1.1 Carbon Monoxide

CO is an odorless, colorless gas that is toxic. It is formed by the incomplete combustion of fuels. The primary sources of this pollutant in King County are automobiles and other sources that burn fossil fuels. Breathing air with high concentrations of CO reduces the amount of oxygen in the blood, causing heart difficulties in people with chronic diseases, reduced lung capacity, and impaired mental abilities (EPA 2025a).

2.1.1.2 Nitrogen Dioxide

NO_2 is a reddish-brown to dark brown gas with an irritating odor. NO_2 forms when nitric oxide (NO) reacts with atmospheric oxygen. The primary source of NO_2 is the combustion of fuel. Significant sources of NO_2 at airports are boilers, aircraft operations, and vehicle movements. NO_2 emissions from these sources are highest during high-temperature combustion, such as aircraft takeoff mode. NO_2 may produce adverse health effects, such as nose and throat irritation, coughing, choking, headaches, nausea, stomach or chest pains, and lung inflammation (e.g., bronchitis, pneumonia) (EPA 2026a).

[1] Ground-level O_3 forms in the atmosphere through complex photochemical reactions involving precursor pollutants—primarily nitrogen oxides (NO_x) and volatile organic compounds (VOCs)—in the presence of sunlight. This process is applicable at the regional scale at which ozone chemistry occurs; therefore, project-level modeling is not an appropriate, reliable, or informative method for predicting indirect changes to regional or localized O_3 concentrations.

2.1.1.3 Particulate Matter and Fine Particulate Matter

Particulate matter consists of solid and liquid particles of dust, soot, aerosols, and other matter small enough to remain suspended in the air for a long period of time. Particles smaller than 10 micrometers (i.e., PM_{10} and $PM_{2.5}$) represent that portion of particulate matter thought to signify the greatest hazard to public health (EPA 2010a). PM_{10} and $PM_{2.5}$ can accumulate in the respiratory system and are associated with a variety of negative health effects. Exposure to particulate matter can aggravate existing respiratory conditions, increase respiratory symptoms and disease, decrease long-term lung function, and possibly cause premature death. Segments of the population that are most sensitive to the negative effects of particulate matter in the air are older adults, individuals with cardiopulmonary disease, and children (EPA 2025b).

A portion of the particulate matter in the air comes from natural sources, such as windblown dust and pollen. Human-made sources of particulate matter include fuel combustion, automobile exhaust, field burning, cooking, tobacco smoking, factories, and vehicle movement, or other human-made disturbances on unpaved areas. Fugitive dust generated by construction activities is a major source of suspended particulate matter. Secondary formation of particulate matter may occur in some cases where gases, such as sulfur oxides (SO_x) and NO_x, interact with other compounds in the air to form particulate matter. In the Puget Sound area, both volatile organic compounds (VOCs) and ammonia are also considered precursors to $PM_{2.5}$.

Secondary sources of particulate matter, SO_x and NO_x, are also major precursors to acidic deposition (acid rain). Human health concerns from acid rain include effects on breathing and the respiratory system, damage to lung tissue, and premature death. Small particles can penetrate sensitive parts of the lungs and can cause or worsen respiratory disease. NO_x has the potential to change the composition of some species of vegetation in wetland and terrestrial systems, create the acidification of freshwater bodies, impair aquatic visibility, create eutrophication of estuarine and coastal waters, and increase the levels of toxins harmful to aquatic life.

2.1.1.4 Sulfur Dioxide

SO_x are formed when fuel containing sulfur (typically coal and oil) is burned, as well as during other industrial processes. The term “sulfur oxides” accounts for distinct but related compounds, primarily SO_2 and sulfur trioxide. As a conservative assumption for this analysis, it was assumed that all SO_x are emitted as SO_2; therefore, SO_x and SO_2 are considered equivalent in this document. Higher SO_2 concentrations are usually found near large industrial facilities.

Physical effects of SO_2 include temporary breathing impairment, respiratory illness, and aggravation of existing cardiovascular disease. Children and older adults are most susceptible to the negative effects of exposure to SO_2 (EPA 2026b).

2.1.1.5 Lead

Pb is a naturally occurring and an industrial contaminant metal that is present in the air primarily as fine particulate matter. Airborne Pb is emitted from sources such as the combustion of Pb-containing fuels, metal processing and smelting operations, waste incineration, and the resuspension of contaminated soil and dust. Although the use of leaded motor vehicle gasoline has been phased out in the United States, legacy emissions remain an important source of airborne Pb, particularly near industrial areas.

Sources of Pb emissions associated with airport activity include combustion of leaded aviation gasoline used in piston-engine aircraft and trace fractions of Pb present in Jet A aircraft fuel.

Exposure to Pb in air can result in a wide range of adverse health effects, even at low concentrations. Pb affects multiple organ systems and is particularly harmful to children, because it can interfere with neurological development, resulting in reduced intelligence, learning difficulties, behavioral problems, and impaired growth. In adults, Pb exposure is associated with increased blood pressure, cardiovascular disease, kidney damage, and reproductive effects. There is no known safe level of Pb exposure, and children, pregnant women, and older adults are the populations most sensitive to the health effects of airborne Pb.

2.1.2 Additional Pollutants of Interest

Additional pollutants of interest include total organic gases (TOG) and VOC. Modeled ground-level concentrations of these pollutants were used to determine individual organic toxic air pollutant (TAP) concentrations, essential to the HHRA.

2.1.2.1 Toxic Air Pollutants of Concern

The selection of TAPs of concern was based on FAA and EPA guidance (FAA 2009; EPA & FAA 2009a, 2009b), including the TAPs that are in the AEDT database. In addition, the Washington Department of Ecology (WADOE) identifies 21 priority TAPs for the State of Washington (WADOE 2008). Finally, specific inorganic TAPs have been identified as trace constituents of Jet A fuel (Shumway 2000).

The list of TAPs of concern identified was developed using these lists, modified to address those pollutants likely to be emitted from the project sources. Common TAPs not likely to be emitted from project sources include wood smoke, chlorinated compounds, and ethylene oxide. This initial list of TAPs was further refined to include only TAPs with WADOE ASILs, de minimis emissions, or small quantity emission rates (SQERs) (Washington Administrative Code [WAC] 2019a). **Table 2.1** provides the resulting list of TAPs of concern evaluated in this HHRA.

Table 2.1 Initial List of Toxic Air Pollutants of Concern for the Sustainable Airport Master Plan

TAP	Type	TAP	Type
Acetaldehyde	VOC	1,2,4-Trimethylbenzene	VOC
Acrolein	VOC	Xylene (total)	VOC
Benzene	VOC	Naphthalene	PAH
1,3-Butadiene	VOC	Diesel PM	Diesel Exhaust
Ethylbenzene	VOC	Arsenic	PM-Metal
Formaldehyde	VOC	Chromium VI	PM-Metal
Isopropylbenzene (Cumene)	VOC	Copper	PM-Metal
Methyl alcohol	VOC	Lead	PM-Metal
Phenol	VOC	Manganese	PM-Metal
Propionaldehyde	VOC	Nickel	PM-Metal
Propylene	VOC	Selenium	PM-Metal

TAP	Type	TAP	Type
Styrene	VOC	Vanadium[1]	PM-Metal
Toluene	VOC	Sulfates	PM-Inorganics

Note:
[1] Although vanadium is included in the initial TAPs list, the speciation profiles used for the emission sources do not contain vanadium; therefore, vanadium was not considered further in this analysis.
Key: PAH = polycyclic aromatic hydrocarbons

2.1.3 Airport Emission Source Estimation Methodologies

Analysis of criteria pollutant emissions for this study began with the information and assumptions used to develop the emissions inventories presented in the Final EA for the SEA SAMP NTPs (Landrum & Brown 2024a). Emission sources used as inputs in the dispersion modeling include:

- Aircraft engines during landing and takeoff cycle (LTO), and during engine runups
- Auxiliary power units (APUs)
- Ground support equipment (GSE)
- Ground access vehicles (on-road motor vehicles), travel on roads and in parking lots
- Stationary sources (boilers, heaters, diesel generators, and fuel farm tankage)
- Construction activities

No changes were made to the emissions estimation methodologies, data sources, or resultant inventories prepared for and presented in the Final EA except for aircraft, APUs, and stationary sources, which were influenced by the modeling refinements between the prior version of FAA's AEDT model used in the Final EA and the updated version used in this analysis.

2.1.3.1 Aviation Environmental Design Tool Version Changes

AEDT 3f was used to estimate emissions for the Final EA and was the current version of the model available at the time its analysis was started. For this assessment, the model was updated to AEDT 3g because it represented the most current and scientifically accurate model version when the analysis was started.[2]

AEDT 3g includes a set of targeted technical updates that refine emissions inventory development and dispersion modeling relative to version 3f. These updates improve consistency with current FAA-accepted data sources and EPA-approved methods, while maintaining the same overall regulatory framework and impact determination approach used in environmental analyses. Compared to AEDT 3f, AEDT 3g incorporates the following specific aircraft-related emissions updates (FAA 2024a):

- Refined fuel burn calculations driven by updated aircraft performance modeling inputs (including expanded use of Base of Aircraft Data [BADA] Version 4 where available) that directly affect emission rates for NO_x, CO, VOC, SO_2, particulate matter, and carbon dioxide.

[2] Although the FAA has since released AEDT 4a, because the air quality analysis was substantially completed prior to its release, model results produced using AEDT 3g were retained and used throughout this analysis (FAA 2026).

- Updated emissions indices and processing for particulate matter, including explicit calculation of non-volatile particulate matter (nvPM) mass and number, using First-Order Approximation (FOA) Version 4.0 and the mission emissions estimation methodology (MEEM), replacing older or less detailed PM representations in AEDT 3f.
- Updated default fuel sulfur content assumptions for aircraft and airport stationary sources, aligned with more recent EPA and FAA reference data.
- Explicit sulfur-to-sulfate conversion factors used in $PM_{2.5}$ calculations, improving representation of secondary particulate formation compared to the simpler treatment in AEDT 3f.
- Revised emissions modeling for stationary sources (e.g., boilers/heaters, fuel tanks, solvent degreasers, training fires), based on updated EPA-approved methodologies documented in the AEDT 3g Technical Manual.
- Enhanced treatment of GSE emissions, including deterioration effects based on equipment age and updated fuel-specific emission factors, providing more realistic annual inventories than AEDT 3f for airports with significant ground operations.
- New plume-rise modeling option for aircraft sources (American Meteorological Society/Environmental Protection Agency Regulatory Model [AERMOD] ALPHA option), allowing buoyancy and momentum effects to be represented more explicitly for aircraft exhaust where appropriate. AEDT 3f did not include this aircraft-specific plume-rise capability.
- More flexible source characterization, including improved treatment of aircraft emissions as volume sources along curved flight tracks, improving spatial allocation of emissions compared to AEDT 3f.

2.1.3.2 Aircraft Engines

Aircraft engine emissions were estimated using FAA's AEDT (version 3g). Aircraft emissions are primarily dependent on the following parameters:

- Aircraft airframe and engine combinations, including the number of engines for each airframe (aircraft fleet).
- Number of operations by each airframe/engine combination for a given scenario (scenario fleet mix).
- Time spent in each operational mode (approach, landing, taxi-in, taxi-out, takeoff, climb out) for each aircraft/engine combination. In AEDT, the operating modes are defined somewhat differently than in previous airport air quality models. Furthermore, in the emissions inventory produced by AEDT, emissions are cumulative and to isolate emissions from a particular mode, it is necessary to subtract the previous mode from the cumulative emissions. The modes of interest for air quality impacts include:
  - Startup (only used to determine VOC emissions for initial 60 seconds of engine on time).
  - Taxi Out (the increment of this mode was previously referred to as Climb Taxi).

- Climb Ground and Climb Below 1,000 feet (the combined increment of these two modes was previously referred to as Takeoff).
- Climb Below Mixing Height (the increment of this mode was previously referred to as Climbout).
- Descend Below Mixing Height and Descend Below 1,000 feet (the combined increment of these two modes was previously referred to as Approach).
- Descend Ground (the increment of this mode was previously referred to as the Landing Roll and includes Reverse Thrust).
- Taxi In (the increment of this mode was previously referred to as Descend Taxi).

- Aircraft engine emissions for each operational mode.
- Number of aircraft operations for each airframe/engine combination (operations per scenario).

The Final EA for the SEA SAMP NTP summarizes the aircraft fleet, scenario fleet mix, and operations, as well as taxi times (Landrum & Brown 2024b).

Time-in-Mode

The modeling includes the primary modes of local operation, such as engine startup, taxiing, takeoff, climb out, and landing. The time spent in each operational mode is calculated using AEDT with the modeled airport layout, scenario fleet mix, and total operations for each scenario. The takeoff/climb out and approach time-in-mode are based on a mixing height at SEA of 3,084 feet and aircraft-specific AEDT 3g operating profiles.

Consistent with the SEA SAMP NTP Final EA, average aircraft taxi-in and taxi-out times used in the air quality analysis are presented in **Table 2.2**.

Table 2.2 Average Taxi Times

Year/Alternative	Taxi-In	Taxi-Out
2032 No Action Alternative	9 minutes, 26 seconds	21 minutes, 28 seconds
2032 Proposed Action	9 minutes, 12 seconds	21 minutes, 18 seconds
2037 No Action Alternative	9 minutes, 41 seconds	21 minutes, 42 seconds
2037 Proposed Action	9 minutes, 45 seconds	23 minutes, 32 seconds

Source: Landrum & Brown 2024b

Aircraft Engine Emission Factors

The AEDT databases include the aircraft engine emission factors for each engine in the scenario fleet mix. As such, the AEDT emission factors are incorporated into the modeling. The AEDT emission factors are based primarily on the International Civil Aviation Organization (ICAO) Engine Emissions Databank. Once an aircraft engine has been assigned to an airframe in the scenario aircraft fleet, AEDT uses the ICAO engine emission factors for that engine to develop emission estimates for that aircraft's operations.

2.1.3.3 Auxiliary Power Units

Total operating time (hours per year) for aircraft APUs were previously estimated using the AEDT APU assignments to aircraft type (airframes) and are presented in the Final EA for the SEA SAMP NTPs (Landrum & Brown 2024c). As noted in the Final EA, APU usage was based on the Port of Seattle's Rules and Regulations.

2.1.3.4 Ground Support Equipment

Tenant-owned GSE was previously determined by conducting a GSE survey (i.e., field verification and Port of Seattle data) to identify equipment types and usage for passenger and cargo aircraft. The information includes the equipment type, fuel type, and annual fuel consumptions for each scenario. The AEDT model's default GSE were used to assign GSE defaults for general aviation aircraft operations. Port-owned GSE were also included in the GSE inventory for each scenario. The Final EA for the SEA SAMP NTPs presents the results (Landrum & Brown 2024d).

2.1.3.5 Ground Access Vehicles

The roadway (on- and off-airport) motor vehicle annual average daily trips (AADT), roadway segment lengths, average speed per segment, surrogate fleet mix, and annual vehicle miles traveled (VMT) for each scenario are included in the Final EA for the SEA SAMP NTPs (Landrum & Brown 2024f). This information was developed from the transportation study conducted for the Final EA and from Washington Department of Transportation (WADOT) data. The Final EA also presents other parameters that influence vehicular emissions, such as travel distances within airport parking lots.

2.1.3.6 Stationary Sources

Stationary sources at the airport include boilers, heaters, diesel generator engines, and fuel farm tanks. Boiler and heater annual fuel consumption, diesel generator engine size, annual operating hours, hourly fuel consumption rate, and annual aircraft Jet A fuel usage are presented in the Final EA for the SEA SAMP NTPs (Landrum & Brown 2024e).

2.1.3.7 Construction Activities

Construction activities for the Proposed Action were developed for each phase of construction in the Final EA for the SEA SAMP NTPs. The Airport Construction Emissions Inventory Tool (ACEIT) was used in the Final EA to determine construction equipment type, horsepower, load factor, and operating hours for each element and phase. EPA's Motor Vehicle Emission Simulator (MOVES) Version 3 was used to determine the emission factor for each construction equipment type. The Final EA for the SEA SAMP NTPs includes the on-road and non-road construction equipment emission factors and emissions inventories (Landrum & Brown 2024g).

2.1.4 Air Dispersion Analysis

Air dispersion modeling was used to estimate ambient criteria pollutant concentrations for the scenarios described in **Section 1.4** for comparison to applicable concentration thresholds. The predicted incremental difference in concentrations between the Proposed Action and No Action scenarios for each modeled year represents the Proposed Action–related contribution to ambient concentrations. Because the No Action Alternative would not require construction, Proposed Action–related incremental concentrations from construction would be equivalent to the modeled concentrations of the

construction needed to implement the Proposed Action minus zero, effectively equaling the full Proposed Action–modeled construction concentrations.

The air dispersion analysis is performed following FAA, EPA, and WADOE modeling guidelines (FAA 2024b, 2026; EPA 2026d; WADOE 2015). The air dispersion analysis requires the following: 1) selection of the dispersion model, 2) evaluation of potential terrain considerations, 3) selection of appropriate dispersion coefficients based on land use, 4) selection and preparation of meteorological data, 5) identification of emission sources, 6) identification of modeling parameters, 7) selection of receptor locations, and 8) selection of appropriate averaging periods. The following sections provide greater details.

2.1.4.1 Model Selection

The first step in an air dispersion analysis is selecting an applicable model. The required air dispersion model to analyze air quality impacts at airports is the FAA's AEDT program, which uses the EPA's AERMOD modeling system for conducting the dispersion analysis (FAA 2015, 2026). As discussed, AEDT 3g was the current version available when the environmental analysis for SEPA began and the current version of AERMOD is 24142; therefore, these are the versions used for this study's air dispersion analysis.

2.1.4.2 Terrain

Terrain data are used to set the base elevation for each source and each receptor incorporated into the model. Terrain data are incorporated in the analysis using National Elevation Dataset (NED) one-third arc-second data, which is available from the U.S. Geological Survey (USGS n.d.). Receptor elevations are determined using the EPA's AERMAP terrain preprocessor. The coordinate system used in the dispersion modeling analysis was the Universal Transverse Mercator (UTM) system, Zone 10 North, referenced to the World Geodetic System 1984 datum.

2.1.4.3 Land Use

Another important consideration in an air dispersion modeling analysis is the selection of rural or urban dispersion coefficients. Consistent with EPA's preferred procedure for determining coefficients between urban or rural, Auer's method of classifying land use was used to analyze the surrounding region. As recommended in the current modeling guidance in EPA's Guideline on Air Quality Models (40 Code of Federal Regulations [CFR] 51, Appendix W), this method calls for the analysis of a 3-kilometer (km) radius around a study location to determine whether most of the land can be classified as either rural (i.e., undeveloped) or urban (EPA 2026d). EPA guidance indicates that if the land use types within the 3 km radius are composed of 50 percent or more of light or heavy industrial (I1 or I2), small-scale commercial (C1), two-family or multifamily zones (R2 or R3), then urban coefficients are to be used. A 50 percent or more combination of these land use types is more likely to cause a heat island effect, making stricter urban coefficients necessary. If the area is composed of less than 50 percent of the indicated land use types, appropriate rural coefficients are the best choice (EPA 2026d). The area in and around SEA is predominantly suburban. As shown in Figure 1.1, the land use types in the area surrounding SEA are primarily single-family residences (R1) and mixed use (MU). There is some industrial areas (I1/I2); however, it makes up less than 50 percent. Therefore, the rural dispersion coefficients are most suited for use in this study's dispersion modeling and are used throughout the analysis.

2.1.4.4 Meteorological Preprocessing

Meteorological data are a critical input to AERMOD because dispersion of aircraft- and airport-related emissions is strongly influenced by wind speed and direction, atmospheric stability, and vertical mixing conditions. Surface meteorological data are used to characterize near-ground wind fields and turbulence that control plume transport and horizontal dispersion, while upper-air meteorological data are used to define temperature profiles, atmospheric stability, and mixing heights that govern vertical dispersion and plume rise. Together, surface- and upper-air data allow AERMOD to represent the three-dimensional structure of the atmosphere and to simulate worst-case dispersion conditions that are relevant for regulatory compliance and air quality impact assessments.

For SEA, use of airport-specific and regionally representative meteorological data is particularly important because of the complex coastal influences, terrain effects, and seasonal wind patterns that can affect pollutant dispersion and concentration patterns near the airport. Accordingly, surface meteorological data from the SEA Automated Surface Observing System (ASOS), paired with upper-air data from Quillayute, Washington, provide a representative characterization of boundary-layer and regional atmospheric conditions consistent with EPA AERMOD and AERMET guidance for coastal and Pacific Northwest applications. Quillayute is the nearest long-term National Weather Service upper-air station with complete, quality-assured data suitable for regulatory dispersion modeling in western Washington, and its use is consistent with EPA guidance when site-specific upper-air observations are not available. Other available upper-air stations, such as Salem, Oregon, or Spokane, Washington, were not selected because their inland locations and differing terrain influences are less representative of the coastal and marine-influenced atmospheric conditions that govern dispersion in the study area.

The analysis uses five years of meteorological data. January 1, 2020 through December 31, 2024 was the five-year period chosen since it is the most recent five-year period that complies with dispersion modeling data completeness requirements. These data were used as inputs in the AERMET preprocessor along with AERMINUTE and AERSURFACE to produce the intermediate and final meteorological data files for use in the AERMOD dispersion analysis.

AERMET/Meteorological Preprocessing Data Inputs

AERMET is AERMOD's meteorological preprocessor. To perform the meteorological preprocessing, published surface and upper-air data were obtained from National Oceanic and Atmospheric Administration (NOAA). These data include the January 1, 2020 through December 31, 2024 surface dataset from SEA and upper-air dataset from Quillayute Airport for the same period:

- Surface Data:
  - Hourly Integrated Surface Data (ISD): Seattle-Tacoma International Airport (KSEA; Weather Bureau Army Navy [WBAN] Station Number 24233) (NOAA n.d.a)
  - 1-Minute ASOS Data: KSEA; WBAN Station Number 24233 (NOAA n.d.b)
- Upper-Air Data:
  - Quillayute Airport, Forks, Washington (KUIL; USM00072797) (NOAA 2026)

As reported in the AEDT database files, a surface station elevation of 131.98 meters is used for SEA. Additionally, an anemometer height of 10 meters is assumed. Because both the surface- and upper-air data are reported in Greenwich Mean Time (GMT), the time zones for both were adjusted by 8 hours for Pacific Standard Time (PST).

AERMINUTE

AERMINUTE is AERMOD's 1-minute ASOS wind data processor. The AERMINUTE preprocessor was developed to reduce the number of missing and calm hours in AERMET processing by substituting standard hourly observations with winds calculated with ASOS wind data. The current version of AERMINUTE (version 15272) was used in the analysis. While 5-minute ASOS data can be used to supplement the 1-minute data when 1-minute data are missing, this substitution is generally only required for 253 stations with missing 1-minute files from June through December 2013 (EPA 2023). Because SEA is not one of the stations with missing data, 5-minute ASOS data were not used in the analysis. EPA recommends using a minimum wind threshold of 0.5 meters per second (m/s) when processing the 1-minute ASOS data (EPA 2013).

AERSURFACE

AERSURFACE is a land cover data preprocessor tool designed to help determine the surface characteristic values required by AERMET. It calculates the following surface characteristics necessary to run AERMET (Lakes Environmental Software 2020):

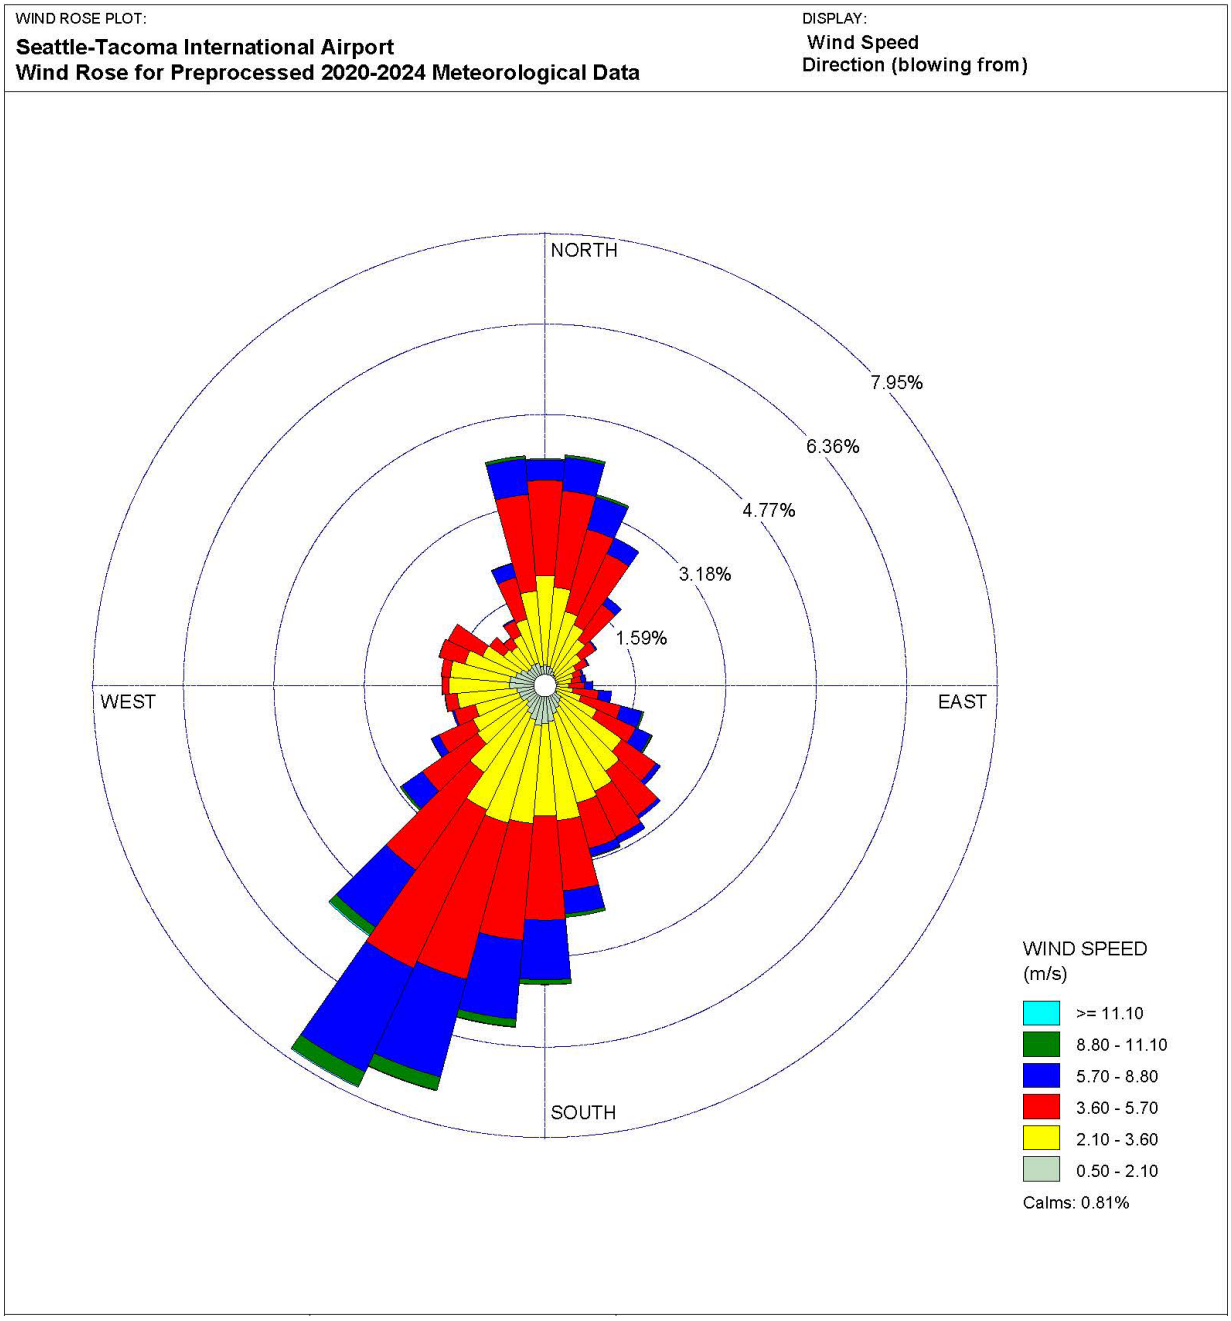
1) Albedo (r) is a measure of the reflectivity of incoming solar radiation.
2) Bowen ratio (B_0) is a measure of dryness at the surface, which impacts atmospheric turbulence and dispersion.
3) Surface roughness (z_0) is a mechanical feature that determines the height aboveground where the wind is zero, which has implications for mechanical turbulence.

Recommendations provided in a EPA webinar presentation on AERSURFACE were applied (EPA 2024b). This study uses the current version of AERSURFACE (version 24142). Land use data files, including tree canopy and impervious percentage data inputs, from the USGS's National Land Cover Database (NLCD) were used as inputs. Annual NLCD datafiles that match the meteorological year being processed (or the most recent NLCD datafile available) were used.

The approximate anemometer location was used as the station location within AERSURFACE. The default method for determining surface roughness, ZORAD, was used within a 1 km radius of the anemometer. ZORAD is a setting used in AERMET that tells the model how far away it should look for land-use and surface characteristics, such as vegetation, pavement, or water, when estimating how air mixes near the ground. In simple terms, it defines the size of the area around the weather station that best represents local surface conditions affecting wind and pollutant dispersion.

Other Considerations

The low-wind option to adjust surface friction velocity (ADJ_U*) was used, as recommended in the current modeling guidance in EPA's *Guideline on Air Quality Models* (40 Code of Federal Regulations [CFR] 51, Appendix W), as well as substitutions for missing cloud cover and ambient temperature data (EPA 2026d). **Figure 2.1** shows the wind rose for the preprocessed meteorological data for 2024.



Note: *Figure created using WRPLOT View by Lakes Environmental Software for SEA using 2020–2024 meteorological data.*

2.1.4.5 Additional Model Parameters

Physical and Temporal Distributions

A critical step to enabling the accurate modeling of local concentrations is preparing a representative model of the airport's layout and activity under each scenario.

Construction

For the dispersion modeling of construction emissions, AERMOD area sources were positioned at locations and in polygon geometries consistent with the NTP areas presented in Figure 1.2. Consistent with standard conventions for dispersion modeling of construction sources, fugitive construction dust was modeled using a surface release height (0 meters) and initial vertical dimension of 1 meter, while vehicle exhaust was modeled using a 5-meter release height and initial vertical dimension of 1.4 meters (South Coast Air Quality Management District [SCAQMD] 2008).

Temporally, the total annual construction emissions associated with each NTP were distributed evenly across their respective phasing schedule, presented in Exhibit 6-1 of the Final EA for the SAMP SEA NTP (Landrum & Brown 2024g). Construction shifts of 12 working hours per day for 5 days each week were assumed.

Operations – Aircraft and Auxiliary Power Units

Aircraft engine emissions occur in operating modes as described in **Section 2.1.3.2**. AEDT 3g was used to simulate the physical movement of aircraft on the airfield and along flight tracks. This simulation generates physical and temporal sources across the airfield representing aircraft operation along runways and taxiways, at gates, or at various stages of the takeoff, climb out, descent, and landing modes, emitting pollutants at distinct positions and heights that strongly control near-field concentration gradients and downwind impacts.

AEDT 3g allows the user to supply specific airfield geometries, including taxi paths and flight tracks, to be used in dispersion modeling. For this air quality analysis, AEDT airfield layouts were assembled to enable AEDT to use the taxi flow patterns presented in Figures 9 through 12 of Appendix A, Forecast and Airport Operational Assumptions, of the SEA SAMP NTP Final EA (Landrum & Brown 2024h). All flight tracks included in the noise modeling performed for the SEA SAMP NTP Final EA that included at least one full aircraft operation were also used (Landrum & Brown 2024i).

To assign the appropriate spatial and temporal distribution of aircraft activity on the airfield, each aircraft operation (arrival or departure) was grouped into combinations that represent the aircraft's class (e.g., passenger air carrier, cargo air carrier, or other). Quarter-hour-of-day, day-of-week, and month-of-year temporal profiles for each of the aircraft groups were developed from Aviation Noise and Operations Monitoring System (ANOMS) aircraft operational data for the SEA SAMP NTP Final EA's existing conditions in 2022. These group temporal profiles were applied to all modeling scenarios. The distribution of aircraft utilization of specific runways for arrivals and departures was carried forward from the noise modeling performed for the SEA SAMP NTP Final EA, consistent with the flight track utilizations.

The dispersion of emissions from aircraft operations at the airport are modeled as AERMOD volume source types generated by AEDT 3g. While on the ground, the release height is set to the FAA default of 12 meters, consistent with light detection and ranging (lidar) data from studies conducted to assess plume rise from aircraft prior to takeoff (Wayson et al. 2004). Takeoff, climb out, and approach sources are modeled at higher elevations aboveground, based on aircraft-specific operating parameters for each aircraft and the aircraft's simulated elevation within 200-meter length and width and 20-meter elevation spaced volumes along all defined aircraft flight tracks. Flight track sources further than 5 km

from the airport property boundary were filtered out of the dispersion analysis because of their high release heights and corresponding negligible influence on local concentrations.

AEDT 3g assumes APU operations occur at aircraft gates. APU activity was assumed to occur prior to taxi-out or following taxi-in for each operation.

Operations – Ground Support Equipment and Ground Access Vehicles

Emissions associated with GSE were distributed evenly across modeled gate locations using AERMOD polygon area sources. GSE activity was assumed to correspond to aircraft activity; thus, aircraft temporal profiles were also assigned to GSE dispersion sources. GSE were modeled using release heights of 4.92 meters and initial vertical dimensions of 3 meters.

Emissions associated with ground access vehicles were distributed evenly using volume sources across the roadway segments and in area source parking locations from the SEA SAMP NTP EA Surface Transportation analysis (Landrum & Brown 2024j). Ground access vehicle activity was assumed to correspond to aircraft activity; thus, aircraft temporal profiles were also assigned to ground access vehicle dispersion sources. Ground access vehicles were modeled using release heights of 1.3 meters and initial vertical dimensions of 1.21 meters for gasoline-fueled light-duty vehicles and release heights of 3.4 meters and initial vertical dimensions of 3.16 meters for diesel-fueled medium- and heavy-duty vehicles. The heights used in the modeling are consistent with the parameters described in the EPA's PM Hot-Spot Guidance (EPA 2021) for light- and heavy-duty vehicles and provide the best current guidance for modeling roadways.

Operations – Stationary Sources

Stationary sources were positioned on the airfield at their specific locations, with annual emissions distributed evenly across the operating year.

Atmospheric Nitrogen Oxides Chemistry

NO_2 concentrations from construction activities were evaluated using the ozone limiting method (OLM) within AERMOD. OLM is an EPA-approved Tier 3 approach that estimates the conversion of NO_x to NO_2 by explicitly accounting for the availability of ambient O_3. OLM provides a more realistic yet conservative representation of short-term NO_2 impacts compared to methods that use fixed conversion ratios, such as the Tier 2 Ambient Ratio Method, Version 2 (ARM2), because it directly incorporates ambient O_3 levels to determine the extent of NO_x-to-NO_2 conversion. This approach is preferred over ARM2 when background O_3 data are available, because it considers the actual chemical environment and yields a more accurate estimate of NO_2 concentrations in situations where O_3 availability is a limiting factor.

OLM and the plume volume molar ratio method (PVMRM) are both EPA-approved Tier 3 screening techniques for estimating NO_2 concentrations from NO_x emissions in AERMOD. OLM is generally preferred for modeling low-level, nonpoint sources such as construction equipment, area sources, and mobile sources, where emissions occur near ground level and lack defined stack parameters. In contrast, PVMRM is designed for elevated point sources with well-characterized stack emissions, where entrainment of ambient O_3 into the plume can be more accurately estimated. EPA's *Technical Support Document (TSD) for NO_2-related AERMOD modifications* notes that while both methods assume instantaneous and irreversible conversion of NO to NO_2 via reaction with O_3, PVMRM attempts to model

O_3 entrainment within the plume volume, whereas OLM assumes full mixing with ambient O_3 (EPA 2015). For construction projects involving diesel equipment and diffuse emissions, OLM provides a more appropriate and conservative approach consistent with EPA's *Guideline on Air Quality Models* (40 CFR 51, Appendix W) (EPA 2026d).

Hourly background O_3 concentrations used in the OLM analysis were obtained from the Seattle – Beacon Hill monitoring station. This site provides long-term, regulatory-grade O_3 data representative of regional oxidant conditions affecting SEA. Use of Beacon Hill data is appropriate for evaluating construction emissions at SEA because O_3 concentrations are regionally homogeneous at the scale relevant to plume transport and chemical conversion.

Construction Equipment Assumptions

Construction emissions were assumed to originate exclusively from diesel-fueled construction equipment, consistent with anticipated airport construction practices. Diesel engines emit NO_x primarily as NO, with a smaller fraction emitted directly as NO_2. This emission profile supports the application of OLM, as NO_2 formation is driven largely by atmospheric chemistry rather than direct emissions.

Construction equipment emissions were developed using ACEIT, which is documented in Airport Cooperative Research Program Report 102 (Transportation Research Board 2014) and was designed to provide consistent airport construction emissions inventories using EPA-recognized non-road emission factor frameworks (e.g., MOVES/NONROAD lineage). ACEIT generates total NO_x emissions for diesel construction equipment rather than speciated NO and NO_2. As a result, application of a single fleet-average in-stack NO_2/NO_x ratio is necessary and appropriate when using Tier 3 NO_2 chemistry options in AERMOD. EPA's Support Center for Regulatory Atmospheric Modeling guidance explicitly recognizes this need and states that in-stack ratio (ISR) values should be selected and documented on a case-by-case basis for the modeled source category (EPA 2026c). This approach is suitable for SEPA assessments, because there is no prescriptive method specified for implementing ISR in these analyses; instead, a reasonable approach is one that is transparent, scientifically supported, and justified based on the characteristics of the emission sources and the best available regulatory guidance.

In-Stack Ratio Selection

The conversion of NO_x to NO_2 from construction activities was evaluated using EPA-approved Tier 3 screening concepts implemented in AERMOD. Consistent with EPA's NO_2 modeling framework, an upper-bound equilibrium NO_2/NO_x ratio of 0.9 was applied to represent the maximum fraction of NO_x that may exist as NO_2 under favorable atmospheric conditions. EPA's TSD for NO_2-related AERMOD modifications explains that the ARM2 response curve explicitly applies a maximum limit of 0.9 on the NO_2/NO_x ratio and discusses this value as a conservative upper bound within EPA's screening methodology, including for Tier 3 methods like OLM (EPA 2015).

Directly emitted NO_2 was represented using a single fleet–average in-stack NO_2/NO_x ratio of 0.15 for all construction equipment. EPA guidance requires that Tier 3 methods such as the OLM specify an in-stack ratio and emphasizes that there is no universal default value; instead, the selected ratio is justified based on source characteristics and the specific application. The EPA NO_2 TSD further documents that early OLM screening formulations commonly assumed approximately 0.10 of NO_x is emitted directly as NO_2 for combustion sources, indicating that values on the order of 10 percent are reasonable for diesel

combustion exhaust. Selection of 0.15 therefore represents a conservative fleet-average assumption that remains within the range supported by EPA's historical screening concepts while accounting for variability in engine technologies and operating conditions. Additionally, a review of the EPA's in-stack ratio database (EPA 2026c) for diesel-fueled internal combustion engines shows an average in-stack ratio of less than 0.1 for diesel internal combustion engine sources, further supporting the use of 0.15 as a reasonable estimate.

Taken together, the use of a 0.9 equilibrium ratio and a 0.15 single fleet–average in-stack ratio, in combination with ACEIT-based diesel construction emissions, provides a technically consistent and conservative representation of NO_2 formation, consistent with EPA's NO_2 modeling guidance and accepted regulatory practice.

Aircraft Plume Rise

AERMOD's aircraft plume-rise implementation was developed to better represent dispersion from aircraft exhaust by accounting for the physical processes that drive how these plumes behave after release. Pandey et al. (2023) developed the aircraft plume-rise formulation to support FAA's use of AERMOD for airport studies, and EPA subsequently incorporated that work into AERMOD through an EPA–FAA collaboration (Porter 2023, 2024). As Pandey et al. describe in their formulation, "aircraft emissions have horizontal momentum corresponding to the forward thrust of the aircraft. In addition, they have buoyancy corresponding to the heat rejected from the aircraft engine" (Pandey et al. 2023). These plume behaviors are well documented in lidar studies and technical reports of aircraft exhaust at major international airports (Wayson et al. 2003, 2004). Without use of the plume-rise implementation, Pandey et al. caution that model predictions "are likely to lead to overestimates of ground-level concentrations because they do not account for the increase of plume height with distance from the source" (Pandey et al. 2023).

AERMOD's current aircraft plume-rise capability is implemented as an ALPHA option flag and therefore not currently approved for federal regulatory use (EPA 2024a). However, the use of the plume-rise function is appropriate for other technical analyses, like SEPA, because if is more scientifically accurate than if plume rise was not considered and designed for the type of analysis included in this report. EPA describes the implementation as an effort to "improv[e] AERMOD performance by including plume rise for area and volume aircraft emission sources" and to support "potential refined source characterizations for $PM_{2.5}$ and NO_2 modeling with AERMOD for airports" (Porter 2024, 2023). EPA specifically lists CAA General Conformity, State Implementation Plan (SIP) planning, attainment demonstrations, and similar assessments as areas of analysis where this refined source characterization would be applicable (Porter 2024, 2023).

The current AERMOD aircraft plume-rise approach has been evaluated against measured air quality data from Los Angeles International Airport (LAX) (Pandey et al. 2024). In their 2024 peer-reviewed study, Pandey et al. (2024) evaluated the current AERMOD implementation and reported composite performance statistic improvements of 71% for NO_x in summertime conditions, with more modest improvements of 12% for NO_x in winter conditions; similar improvements were also identified for SO_2—19% in summer and 6% in winter. Pandey et al. (2024) concluded that use of plume rise "is likely to improve AERMOD's ability to estimate the impact of airport emissions on surrounding air quality."

Lead Concentrations

The version of AEDT (version 3g) used in the analysis does not natively support dispersion modeling for ground-level Pb concentrations. Therefore, ground-level Pb concentrations were estimated using SO_2 as a proxy for Pb, and the ratio of Pb emissions to SO_2 emissions from piston-engine aircraft was used to convert SO_2 concentrations to Pb concentrations.

Pb emissions from aircraft operations were estimated using a fuel-based approach. Pb emissions originate almost exclusively from the combustion of leaded aviation gasoline (100 low lead [100LL]) used in piston-engine aircraft and, therefore, scale directly with fuel consumption. Trace fractions of Pb are also present in Jet A; thus, Pb emissions from jets exhaust are also directly proportional with fuel consumption. SO_2 emissions are calculated in AEDT as a direct function of fuel burn and fuel sulfur content and, accordingly, SO_2 emission can serve as a surrogate to estimate Pb concentrations though application of a Pb-to-SO_2 mass ratio to modeled SO_2 concentrations. For piston aircraft, a ratio of 0.56 reflects the relative Pb-to-sulfur content of 100LL aviation gasoline under AEDT 3g default fuel property assumptions. For jet aircraft, a trace fuel fraction of 11 parts per billion (ppb) Pb in fuel was used (Shumway 2000).

2.1.4.6 Receptor Locations

Locations of receptors are determined such that peak ambient air pollutant impacts associated with each scenario are identified. SEA property line receptors and community receptors around SEA are included in the analysis. A receptor grid was developed under the following stepwise approach:

1) Outward from the Airport's center in 100-meter spacings, receptors were placed out to a maximum radius from the airport of 3,000 meters. Because the modeling did not show that maximum concentrations could occur beyond this radius, additional receptor placement was not required.
2) For each modeled emission source, receptors were placed radially in incrementally increasing spacings:
    a) From meters 0 to 150 from the source, 25-meter spacings were used.
    b) From meters 150 to 400 from the source, 50-meter spacings were used.
    c) From meters 400 to 1,000 from the source, 100-meter spacings were used.
3) Receptors that fall within the exclusion zone of an AERMOD volume source (e.g., roadway) were shifted directly away from the applicable source for the minimum possible distance to be outside of the exclusion zone.[3]
4) Those receptors generated by Steps 1 through 3, which fall within the radial grids of more closely spaced grids, and any receptors falling on airport property, are filtered out.

[3] Volume source exclusion zones in AERMOD are a defined radius around a volume source where the model suppresses near-field concentrations to avoid unrealistic plume overlap or double-counting of emissions. They help ensure that dispersion is calculated only outside a defined buffer where the model's assumptions about plume spread are considered valid.

5) Receptors with no greater than 100-meter spacing were placed along the airport's property boundary; the spacing is generally lower than 100 meters to preserve property boundary geometry.

6) Discrete sensitive receptors for identified sensitive land uses, including hospitals, schools, day care centers, and convalescent homes, are added at their precise locations.

7) Discrete sensitive receptors that fall within the exclusion zone of an AERMOD volume source (e.g., roadway) were shifted directly away from the applicable source for the minimum possible distance to be outside of the exclusion zone.

Figure 2.2 shows the identified receptors in this study. The property boundary is consistent with that used in the Final EA. Flagpole receptors, or receptors at the height of 1.8 meters, were not used. Instead, ground-level concentrations were modeled.

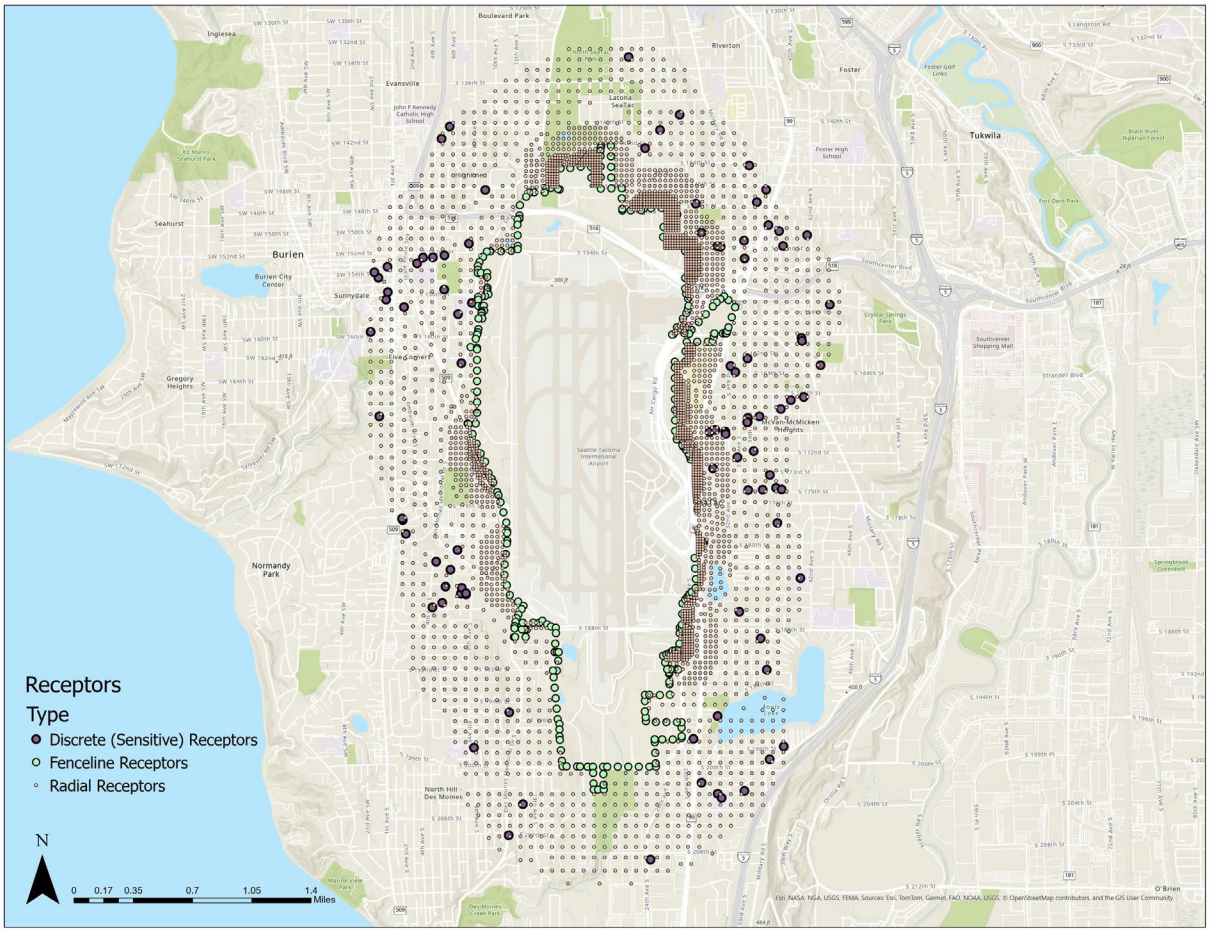

Figure 2.2 Receptor Locations

2.1.4.7 Averaging Periods

Calculation of criteria pollutant concentrations is based on specific averaging periods that are assigned in the AERMOD model. Modeled averaging periods include those corresponding to the NAAQS for each criteria pollutant, and to 1-hour, 24-hour, and annual averaging periods for VOC and TOG, as well as for

PM_{10} and SO_2 in addition to their NAAQS averaging periods. **Table 2.4** in **Section 2.1.5.1** provides these averaging periods.

The specific way in which the background data used in the analysis and the resulting concentrations at each averaging period are evaluated is referred to as the design value, which is specific for each pollutant and averaging period included in the NAAQS. The following paragraphs describe how these data requirements are addressed in the analysis.

NO_2 Guidance

For the 1-hour NO_2 averaging period, modeled concentrations were processed to reflect the form of the NAAQS, defined as the 3-year average of the annual 98th percentile of the daily maximum 1-hour NO_2 concentrations. Consistent with the Appendix W guidelines, dispersion modeling was conducted using five years of representative National Weather Service (NWS) meteorological data (or at least one year of site-specific data), and the resulting annual 98th percentile 1-hour concentrations was averaged across all modeled years. The 5-year average of modeled concentrations (based on 5 years of representative meteorological data) serves as an unbiased estimate of the 3-year average, as defined by the NAAQS; therefore, EPA does not recommend a "rolling average" of 3 years of modeled results. The method used in this analysis is consistent with the recommendations in the guidance document.

For cumulative impact assessments, EPA guidance (EPA 2010b) recommends a first-tier approach in which the highest observed 1-hour NO_2 design value concentration from a representative ambient monitor is added to the modeled design value. This approach is preferred over combining modeled and monitored percentiles, which could understate the true cumulative distribution. Additional refinements, such as temporal pairing of modeled and monitored values, may be considered on a case-by-case basis with adequate justification and approval by the reviewing authority.

$PM_{2.5}$ Guidance

EPA recommends that the representative monitored $PM_{2.5}$ 24-hour design value, rather than the overall maximum monitored background concentration, be used when determining the $PM_{2.5}$ background concentration in its *Guidance for $PM_{2.5}$ Permit Modeling* (EPA 2014a). As such, the 3-year average of the annual average monitored $PM_{2.5}$ concentrations was used for the annual average background concentration. Additionally, the 3-year average of the annual 98th percentile 24-hour value was used for the 24-hour average background concentration. As previously described for NO_2, the 5-year average modeled concentration from 5 years of representative meteorological data was used in the analysis.

When evaluating compliance with the NAAQS, EPA describes a tiered approach, with the first tier being "that the modeled design value be added to the monitored design value from a representative monitor." This means that the 5-year average of the 98th percentile of modeled annual 24-hour concentrations would be added to the monitored background values. The second tier involves combining the monitored and modeled $PM_{2.5}$ concentrations on a seasonal or quarterly basis; however, the first tier provides a conservative assessment and the second tier is not recommended for this analysis.

Therefore, to demonstrate compliance with the $PM_{2.5}$ NAAQS, the 5-year average of the 24-hour and annual average modeled concentrations were added to the respective 3-year averages of the monitored background concentrations (i.e., modeled design value added to monitored design value).

SO_2 Guidance

For the 1-hour SO_2 NAAQS, modeled concentrations were evaluated consistent with the standard's form, defined as the 3-year average of the annual 99th percentile of the daily maximum 1-hour SO_2 concentrations, with a level of 75 ppb. In accordance with the Appendix W guidelines, dispersion modeling used five years of NWS meteorological data (or a minimum of one year of site-specific data), and the resulting annual 99th percentile concentrations were averaged across the modeled years to approximate the 3-year monitored design value.

For cumulative analyses, EPA recommends a conservative first-tier background approach whereby the single-highest monitored, 1-hour SO_2 background concentration from a representative monitor is added to the modeled design value, consistent with the form of the NAAQS (EPA 2010c). This approach avoids potential underestimation that could result from percentile-based combinations of modeled and monitored data. More refined background treatments, including limited temporal pairing, may be applied with appropriate justification and concurrence from the reviewing authority.

Background Data Approach Summary

For this analysis, background represents existing concentrations of criteria pollutants in the ambient environment that are not attributed to the Proposed Action or No Action Alternative. Including this information is essential for a comprehensive assessment of cumulative impacts, as it enables total pollutant concentrations predicted by dispersion modeling reflect both project-related emissions and existing environmental conditions.

Table 2.3 summarizes the methods for calculating the monitored background concentrations that were used to evaluate the project's compliance with the NAAQS. The calculated background levels are consistent with how the design values for each pollutant are calculated, which are summarized as follows:

- CO, NO_2, SO_2, and PM_{10}: Maximum background concentration from the past 3 years of monitoring data for each averaging period
- $PM_{2.5}$: Maximum of the 3-year average for each averaging period

In the case of PM_{10}, the NAAQS allows one exceedance over the past 3 years, thereby allowing the second highest monitored value to be used for the background concentration. However, to be conservative, the highest value was used instead.

Table 2.3 Method to Calculate Background Concentration for National Ambient Air Quality Standard Evaluation

Pollutant	Averaging Period	NAAQS Form Description	Calculated Background Concentration[1]	Modeled Concentration[2]
CO	1-hour	Not to be exceeded more than once per year	Highest recorded hourly concentration from the most recent 3 years of data	1st Highest High (H1H)
	8-hour	Not to be exceeded more than once per year	Highest recorded 8-hour concentration from the most recent 3 years of data	1st Highest High (H1H)
NO_2	1-hour	Annual 98th percentile of 1-hour daily maximum concentrations, averaged over 3 years	Maximum of the 8th highest hourly concentrations for the most recent 3 years of data	8th Highest High (H8H)
	Annual	Annual mean	Maximum average annual concentration over 3 years of data	1st Highest High (H1H)
$PM_{2.5}$	24-hour	98th percentile, averaged over 3 years	Average of the 8th highest hourly concentrations for the most recent 3 years of data	8th Highest High (H8H)
	Annual	Annual mean, averaged over 3 years	Maximum average annual concentration over 3 years of data	1st Highest High (H1H)
PM_{10}	24-hour	Not to be exceeded more than once per year on average over 3 years	Maximum average annual concentration from the most recent 3 years of data	1st Highest High (H1H)
SO_2	1-Hour	Annual 99th percentile of 1-hour daily maximum concentrations, averaged over 3 years	Maximum of the 4th highest hourly concentrations for the most recent 3 years of data	4th Highest High (H4H)
	Annual	Annual mean, averaged over 3 years	Maximum average annual concentration over 3 years of data	1st Highest High (H1H)

Source: EPA 2025c

Note:

1. The calculated background value is based on the most recent three years of complete monitoring data (i.e., 2023 to 2025).
2. The modeled concentration is based on the estimated concentration from the past 5 years of meteorological data (i.e., 2020 to 2024). Because the modeling analysis started in 2025, a complete year of 2025 meteorological data was not available at the time; therefore, 2024 was used as the most recent available year of meteorological data.

2.1.5 Benchmarks

2.1.5.1 Criteria Air Pollutant Significance Thresholds

For the criteria air pollutants CO, NO_2, PM_{10}, $PM_{2.5}$, and SO_2, the modeled Proposed Action–related contribution is added to the background, and the results are compared to the NAAQS to assess compliance and the potential for significant impacts. If the modeled Proposed Action–related contribution pollutant level plus its applicable background level is below the applicable primary or secondary NAAQS, it indicates compliance with the air quality standard for that pollutant and no probable significant impact.

Table 2.4 summarizes the NAAQS for the criteria air pollutants included in this study.

Table 2.4 National Ambient Air Quality Standards

Pollutant	Averaging Period	Primary Standard	Secondary Standard	Form
CO	8 hours	9 ppm	None	Not to be exceeded more than once per year
	1 hour	35 ppm		
Pb	Rolling 3-month average[1]	0.15 µg/m^3	Same as primary	Maximum arithmetic mean of 3 consecutive monthly means in a 3-year period
NO_2	1 hour	100 ppb	None	Annual 98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
	1 year	53 ppb	Same as primary	Annual mean
$PM_{2.5}$	1 year	9.0 µg/m^3	15.0 µg/m^3	Annual mean, averaged over 3 years
	24 hours	35 µg/m^3	Same as primary	98th percentile, averaged over 3 years
PM_{10}	24 hours	150 µg/m^3	Same as primary	Not to be exceeded more than once per year on average over 3 years
SO_2	1 hour	75 ppb	None	Annual 99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
	1 year	None	10 ppb	Annual mean, averaged over 3 years

Source: EPA 2025c.

Note:

[1] The Pb NAAQS is based on a 3-month rolling average, which is not calculated in AERMOD for SO_2; therefore, for project modeling, a one-month averaging period is used to provide a conservative evaluation of the Pb NAAQS.

Key: µg/m^3 = micrograms per cubic meter

2.1.5.2 Toxic Air Pollutant Screening Criteria

WADOE Chapter 173-460 WAC "Controls for New Sources of Toxic Air Pollutants" was developed specifically for new stationary sources of TAPs subject to air quality permitting. While there are smaller elements of the SAMP NTPs that focus on stationary infrastructure, the primary focus is on infrastructure that are mobile, such as planes. Therefore, requirements of this regulation are not directly applicable to this study. However, the de minimis emissions and SQER thresholds, as well as ASIL, may be used to screen out those TAPs that would not pose a significant impact to human health from the SAMP NTP.

Table 2.1 lists the TAPs that were analyzed for potential health risk impacts. Emissions of those contaminants were estimated following the methodology described in **Section 2.1.3** of this study. Those TAPs on this list that have Proposed Action–related emission rates above the de minimis value or above the SQER value (whichever value is lower) were carried into the dispersion modeling analysis described in **Section 2.1.4** of this study. Finally, those TAPs estimated to have project concentration levels above the ASIL value were carried into the health risk assessment described in Section 3.0 of this study.

The de minimis, SQER, and ASIL values listed in WAC 173-460-150 for the TAPs listed in Table 2.1 are presented in **Table 2.5**.

Table 2.5 List of Acceptable Source Impact Level, Small Quantity Emission Rate, and De Minimis Values for Toxic Air Pollutants

2.2 Affected Environment

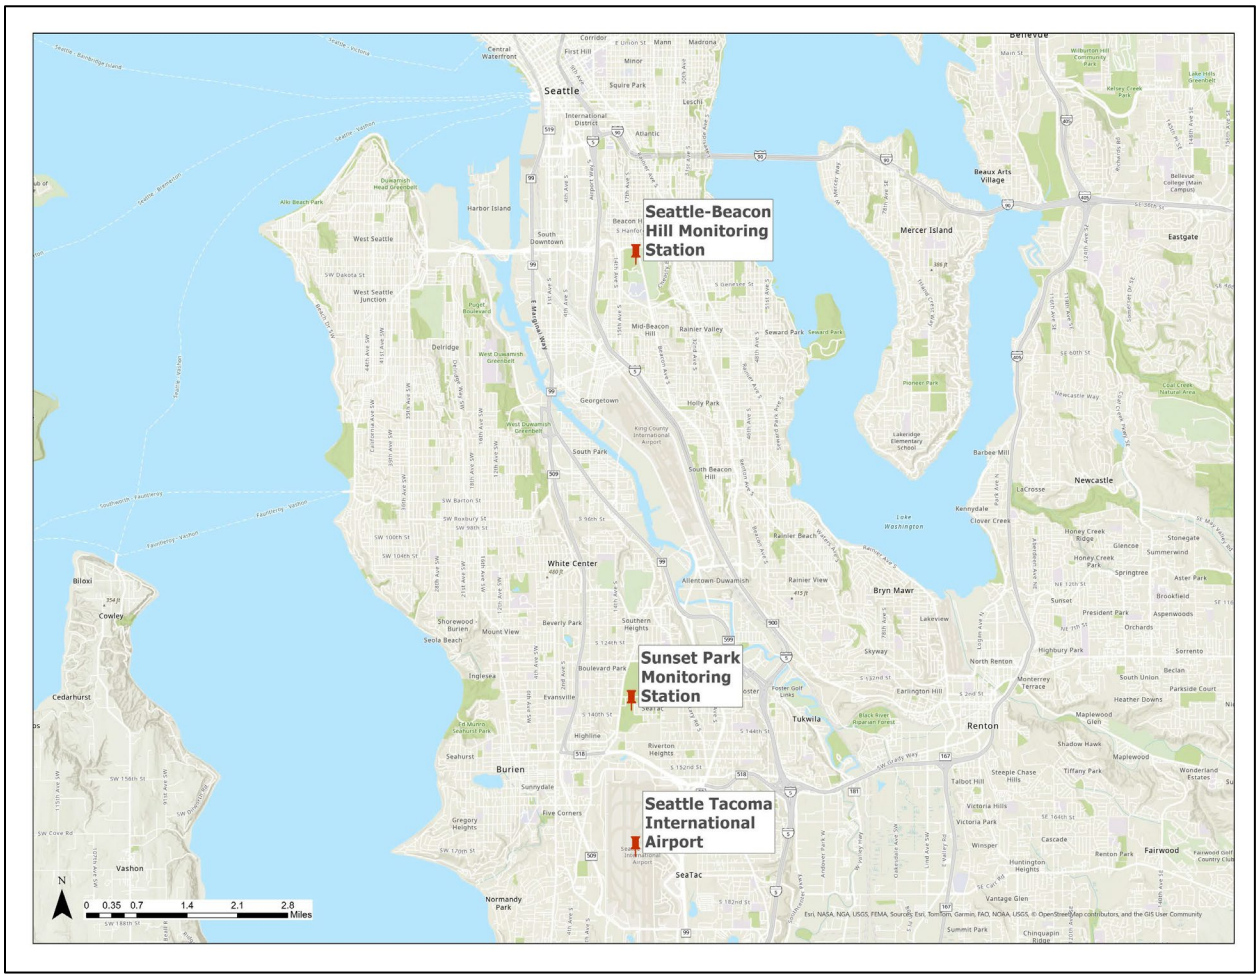
2.2.1 Existing Ambient Air Quality

In any location, there are existing pollution levels from automobiles, industry, and other sources unrelated to SEA. Estimated background concentrations, which are assumed to be unaffected by emissions associated with SEA, were added to the modeled results from the airport before comparing them to the NAAQS.

Background criteria air pollutant concentrations were obtained from monitoring stations in the Seattle area. Specifically, concentrations of CO, NO_2, SO_2, $PM_{2.5}$, PM_{10}, and Pb were estimated from the most recent three years of monitoring data collected at the Beacon Hill Station in the City of Seattle.

Additionally, $PM_{2.5}$ concentrations from the Sunset Park Station in the City of SeaTac are summarized for informational purposes but are not used for background concentrations because three complete years of data are not available.

Figure 2.3 illustrates the monitoring station locations used for background pollutant concentrations in relation to SEA, and **Table 2.6** summarizes the background concentrations used in the analysis.



Source: WADOE Washington Air Quality Map https://airqualitymap.ecology.wa.gov

2.2.2 Fine Particulate Matter Ambient Levels

The Sunset Park $PM_{2.5}$ monitoring station in the city of SeaTac, operated by the Puget Sound Clean Air Agency, was installed in 2024 and became fully operational in spring 2025 following commissioning and quality assurance procedures. The air monitoring station was established to characterize $PM_{2.5}$ concentrations in communities located immediately north of SEA, an area influenced by a combination of airport operations, major roadway traffic (including State Route [SR]-99 and Interstate 5), and nearby industrial and urban sources. Operated as part of the regional ambient air quality monitoring network, the station provides continuous, quality-assured $PM_{2.5}$ data used to assess compliance with NAAQS and to track long-term air quality trends in a location representative of population exposure near the airport environment.

Because the station was only established in 2024, it did not contain enough background data to be used in the analysis. A review of the hourly monitoring data available from April 7, 2025 (first date of available data) and February 3, 2026 (last date of available data when downloaded) shows a maximum 24-hour average concentration of 16.3 micrograms per cubic meter (µg/m^3), which is substantially below the NAAQS of 35 µg/m^3.

Figure 2.4 shows the frequency of daily $PM_{2.5}$ concentration values from the Sunset Park monitoring station in the City of SeaTac. To interpret the histogram chart, the bracketed values show a range of concentration values. For example, the first bracket shows the frequency of all concentration values between 1.1 and 2.5 µg/m^3 from the analyzed data. As shown, there were 57 data points that had concentration values within this range. The data show that most concentrations are below 9.5 µg/m^3.

Annual averages are not provided because of incomplete annual data. The presented 24-hour average values are not regulatory design values because of the lack of sufficient data and the likely inclusion of data from exceptional events like wildfires or wood burning during winter.[4]

2.3 Emissions Inventory Results

The emissions inventory provides a comprehensive overview of the annual criteria pollutant emissions associated with the Proposed Action and No Action Alternatives in each analysis year, including construction phases and future operations. By comparing year-to-year variations in emissions, this section discloses how project development time frames and operational demands influence overall pollutant emissions.

2.3.1 Construction

Table 2.7 presents the annual criteria for pollutant emissions directly associated with construction activities for each year of construction (i.e., 2025 to 2032). The year-to-year variations between the different years are largely attributable to the differences in the near-term project development time

[4] Exceptional events are rare, uncontrollable occurrences—such as wildfire smoke—that are not reasonably preventable and can be excluded by EPA from air quality design value calculations when they are demonstrated to have caused exceedances beyond normal anthropogenic conditions.

frames and construction needs. There were no changes to construction emissions between the current analysis and that completed for the SEA SAMP NTP Final EA.

Table 2.7 Construction Emissions Inventory – Proposed Action

Year	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	$PM_{2.5}$ (tons)
2025	17	1	8	<1	8	1
2026	124	3	24	<1	8	2
2027	204	4	36	<1	9	2
2028	214	5	40	<1	9	2
2029	239	5	36	<1	9	2
2030	181	3	24	<1	8	2
2031	143	2	18	<1	8	1
2032	40	1	9	<1	8	1

2.3.2 Operations

The operations analysis identified shows small increases in the emissions inventory from those found in the Final EA. While the underlying source data are unchanged between the current analysis and that of the Final EA, the upgrade to AEDT 3g resulted in changes to the aircraft and stationary source emission associated with changes in the model assumptions and calculation methods. However, the changes in the analysis can be seen in both the No Action emissions inventory and the Proposed Action. Therefore, the overall difference between the No Action and the Proposed Action to be presented in the SEA SAMP NTP remains similar to that presented in the Final EA and there are no differences in the conclusions.

2.3.2.1 No Action Alternative

2032 No Action Alternative Emissions Inventory

Table 2.8 summarizes the 2032 No Action Alternative emissions inventory.

Overall, the revised inventory for this report shows modest increases in CO, NO_x, VOC, and SO_x relative to the Final EA, primarily driven by updated aircraft fuel burn algorithms, revised emissions indices, and improved representation of sulfur content and secondary particulate formation in AEDT 3g. Particulate matter emissions remain generally comparable between the two inventories, with small shifts attributable to enhanced particulate matter chemistry and explicit calculation of nvPM in the updated model. These trends are consistent with the use of a more current, scientifically refined emissions modeling framework and do not indicate a substantive change in future conditions.

Table 2.8 Emissions Inventory – Future (2032) No Action Alternative

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	PM2.5 (tons)

2037 No Action Alternative Emissions Inventory

Table 2.9 summarizes the 2037 No Action Alternative emissions inventory. As described previously, no changes were made to the aircraft fleet mix or other data sources, but there are observable changes in the emissions inventory from the revised model's algorithms and assumptions. Like the 2032 No Action Alternative, modest increases in gaseous pollutant emissions are observed when compared to the Final EA, while negligible changes are found for particulate matter emissions.

Table 2.9 Emissions Inventory – Future (2037) No Action Alternative

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	PM2.5 (tons)

2.3.2.2 Proposed Action

2032 Proposed Action Emissions Inventory

Based on the preliminary construction schedule for the individual Proposed Action components, the improvements associated with the Proposed Action would be completed in 2032; therefore, operational impacts associated with those improvements were analyzed for the first year of operations, or 2032. Like the No Action alternatives, because of the upgrade to AEDT 3g, modest increases in gaseous pollutant emissions were observed when compared to the Final EA, while negligible changes were found for particulate matter emissions. **Table 2.10** provides the 2032 Proposed Action emissions summary.

Table 2.10 Emissions Inventory – Future (2032) Proposed Action

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	$PM_{2.5}$ (tons)
Aircraft	**2,778**	**291**	**2,933**	**307**	**28**	**28**

2037 Proposed Action Emissions Inventory

Emission inventories were also prepared for five years after the completion of construction, or 2037. As with the other alternatives, because of the upgrade to AEDT 3g, modest increases in gaseous pollutant emissions were observed when compared to the Final EA, while negligible changes were found for particulate matter emissions. **Table 2.11** provides the 2037 Proposed Action emissions summary.

Table 2.11 Emissions Inventory – Future (2037) Proposed Action

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	$PM_{2.5}$ (tons)
Aircraft	**3,008**	**299**	**3,353**	**343**	**32**	**32**

2.3.2.3 Comparison of Alternatives

Results of the emission inventories prepared for the 2032 and 2037 Proposed Action scenarios were compared to the results of the emission inventories prepared for the 2032 and 2037 No Action Alternative scenarios, respectively, to disclose the reasonably foreseeable project-related changes in emissions.

2032 Proposed Action Compared to 2032 No Action Alternative

The comparison of Future (2032) Proposed Action and Future (2032) No Action Alternative emissions are shown in **Table 2.12**.

Table 2.12 Summary of Emissions – Future (2032) Proposed Action and Future (2032) No Action Alternative Total Emissions

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	$PM_{2.5}$ (tons)
Future (2032) No Action Alternative	5,060	323	3,053	345	33	32
Future (2032) Proposed Action	5,173	330	3,122	366	42	34
Construction	*40*	*1*	*9*	*<1*	*8*	*1*
Operations	*5,132*	*330*	*3,113*	*366*	*34*	*33*
Future (2032) Increase in Emissions	**113**	**7**	**69**	**21**	**9**	**2**

Source: CDM Smith 2026

Emissions of all criteria air pollutants would be greater under the Proposed Action than the No Action Alternative in 2032. Although model formulation changes between AEDT versions 3f and 3g would result in increased emissions, as discussed, the absolute difference in emissions between the Proposed Action and No Action Alternative would be comparable to those disclosed in the SEA SAMP NTP EA.

Annual aircraft operations are forecast to increase to 475,655 aircraft operations in the Future (2032) Proposed Action scenario from 466,900 aircraft operations in the Future (2032) No Action Alternative scenario, an increase of 1.9 percent. As shown in Table 2.12, operations-related emissions increases would range from a 1.4 percent (CO) to 2.2 percent ($PM_{2.5}$) for all criteria pollutants except for SO_x, which would increase by 6.0 percent owing to increased project-related stationary source SO_x emissions.

2037 Proposed Action Compared to 2037 No Action Alternative

The comparison of Future (2037) Proposed Action and Future (2037) No Action Alternative emissions are shown in **Table 2.13**.

Table 2.13 Summary of Emissions – Future (2037) Proposed Action and Future (2037) No Action Alternative Total Emissions

Emission Source	CO (tons)	VOC (tons)	NO_x (tons)	SO_x (tons)	PM_{10} (tons)	$PM_{2.5}$ (tons)
Future (2037) No Action Alternative	4,571	303	3,216	352	33	33
Future (2037) Proposed Action	5,025	335	3,486	401	36	34
Future (2037) Increase in Emissions	**454**	**32**	**270**	**49**	**3**	**1**

Source: CDM Smith 2026

Emissions of all criteria air pollutants would be greater under the Proposed Action than the No Action Alternative in 2037. Although model formulation changes between AEDT versions 3f and 3g would result in increased emissions, the absolute difference in emissions between the Proposed Action and No Action Alternative would be similar to those disclosed in the SEA SAMP NTP EA.

Annual aircraft operations are forecast to increase to 509,892 aircraft operations in the Future (2037) Proposed Action scenario from 474,874 aircraft operations in the Future (2037) No Action Alternative scenario, an increase of 7.4 percent. As shown in Table 2.13, operations-related emissions increases would generally be greater than the direct proportional emissions increase because of, in part, to increased aircraft taxi times and AEDT 3f and 3g model formulation changes. These increases range from 2.8 percent ($PM_{2.5}$) to 10.5 percent (VOC) for all criteria pollutants, except for SO_x, which would increase by 13.9 percent because of the increased project-related stationary source SO_x emissions.

2.4 Dispersion Modeling Results

The dispersion modeling results provide a comprehensive assessment of air pollutant concentrations resulting from constructing and operating the Proposed Action as compared to the No Action Alternative. These findings detail levels of criteria pollutants, which are compared against the NAAQS when evaluating compliance.

2.4.1 Construction

Table 2.14 summarizes the results of air dispersion modeling of the Proposed Action construction sources. As shown in the table, local construction concentrations would be less than the NAAQS for all pollutants. **Appendix A** provides the figures showing the impacts of the construction activities.

Table 2.14 Maximum Construction Concentrations and Comparison to National Ambient Air Quality Standard

Pollutant	Averaging Period	Maximum Concentration (µg/m³)	Background Concentration (µg/m³)	Peak Total Concentration (µg/m³)[a]	NAAQS (µg/m³)	Exceed NAAQS?
CO	1 hour	243	1,087	1,330	40,000	No
	8 hours	52	916	968	10,000	No
NO_2[b]	1 hour	106	79	185	188	No
	Annually	8	18	25	100	No
$PM_{2.5}$	24 hours	6	11	16	35	No
	Annually	1.4	4.6	6.0	9.0	No
PM_{10}	24 hours	27	34	61	150	No
SO_2	1 hour	1	8	9	198	No
	Annually	<1	1	1	26	No

Notes:

[a] Totals may not add exactly because of rounding.

[b] NO_2 concentrations include OLM processing with an NO_x/NO_2 ISR of 0.15.

2.4.2 Operations

2.4.2.1 2032 Proposed Action Compared to 2032 No Action Alternative

Table 2.15 summarizes the 2032 Proposed Action incremental increases in peak concentrations relative to the 2032 No Action Alternative. The incremental concentration increases, which isolate the environmental impact that would occur from implementation of the Proposed Action, were then added to the pollutants' respective background concentrations for each applicable averaging period. The total concentrations (increment plus background) were then compared to the NAAQS to determine whether an impact could occur. As shown in the table, the incremental change in pollutant concentrations resulting from operational activities would not exceed the NAAQS. **Appendix A** provides the geographic extent of the ground-level pollutant concentrations.

Table 2.15 Operational Concentrations – Peak Increment of 2032 Proposed Action Concentrations Compared to 2032 No Action Alternative Concentrations

Pollutant	Averaging Period	Incremental Peak (µg/m³)	Background (µg/m³)	Total (µg/m³)[a]	NAAQS (µg/m³)	Exceed NAAQS?
CO	1 hour	218	1,087	1,305	40,000	No
	8 hours	83	916	999	10,000	No
Pb	Rolling 3-month average	0.000022	0.022	0.022	0.15	No
NO_2[b]	1 hour	21	79	100	188	No
	Annually	5	18	23	100	No
$PM_{2.5}$	24 hours	1	11	12	35	No
	Annually	0.3	4.6	4.9	9.0	No
PM_{10}	24 hours	3	34	37	150	No

Pollutant	Averaging Period	Incremental Peak (µg/m³)	Background (µg/m³)	Total (µg/m³)[a]	NAAQS (µg/m³)	Exceed NAAQS?
SO_2	1 hour	118	8	126	197	No
	Annually	17	1	18	26	No

Source: CDM Smith 2026
Notes:
[a] Totals may not add exactly because of rounding.
[b] NO_2 concentrations include special processing to account for the plume rise from aircraft exhaust.

2.4.2.2 2037 Proposed Action Compared to 2037 No Action Alternative

Table 2.16 presents the incremental increases in pollutant concentrations for the Proposed Action compared to the No Action Alternative. These increases, combined with background levels, were assessed against the NAAQS, showing no exceedances. **Appendix A** details the spatial distribution of ground-level pollutant concentrations.

Table 2.16 Operational Concentrations – Peak Increment of 2037 Proposed Action Concentrations Compared to 2037 No Action Alternative Concentrations

Pollutant	Averaging Period	Incremental Peak (µg/m³)	Background (µg/m³)	Total (µg/m³)[a]	NAAQS (µg/m³)	Exceed NAAQS?
CO	1 hour	341	1,087	1,428	40,000	No
	8 hours	88	916	1,005	10,000	No
Pb	Rolling 3-month average	0.000025	0.022	0.022	0.15	No
NO_2[b]	1 hour	22	79	101	188	No
	Annually	6	18	24	100	No
$PM_{2.5}$	24 hours	2	11	13	35	No
	Annually	0.5	4.6	5.0	9.0	No
PM_{10}	24 hours	4	34	38	150	No

Notes:
[a] Totals may not add exactly because of rounding.
[b] NO_2 concentrations include special processing to account for the plume rise from aircraft exhaust.

2.5 Scenario Comparison

Section 2.4.2 presents a comparative analysis of air pollutant concentrations and associated impacts under the Proposed Action and No Action Alternatives for 2032 and 2037, as summarized in the provided tables. Results indicate that, overall, the Proposed Action scenario exhibits small increases in certain pollutant concentrations compared to the No Action scenario. Notably, NO_2 concentrations, which include adjustments for plume rise from aircraft exhaust, show slight concentration increases in areas immediately adjacent to aircraft ground operations. However, these increases remain below the NAAQS.

Further comparison of the scenarios highlights that particulate matter ($PM_{2.5}$ and PM_{10}) and VOCs either remain relatively stable or experience minimal increases. These changes are primarily attributable to incremental growth in aircraft activity. The differences observed between scenarios are minor, indicating that implementation of the Proposed Action would not substantially alter the air quality in the area.

Additionally, the data suggest that the highest modeled concentrations are localized near operational hotspots, such as taxiways and idling zones, but decrease with distance from the airport boundaries. Sensitive receptors, such as schools and residential areas, are expected to experience only marginal changes in pollution levels.

2.6 Conclusions

In conclusion, the comparative evaluation of air pollutant concentrations under both the Proposed Action and No Action scenarios for 2032 and 2037 confirms that the anticipated changes resulting from the Proposed Action are minor and localized. While slight increases in certain pollutants, particularly NO_2, are projected in areas immediately adjacent to aircraft ground operations, these concentrations remain below the NAAQS. Other pollutants, such as particulate matter ($PM_{2.5}$ and PM_{10}) and VOCs, are expected to remain stable or show only minimal increases due to incremental growth in aircraft activity.

As discussed in the Final EA, the Port of Seattle has been in coordination with the Puget Sound Clean Air Agency (PSCAA) about the potential emission increases and their relationship to the NAAQS. The Final EA states that PSCAA does not believe the emission increases could cause a violation of the NAAQS. While there are some slight differences in the emissions inventory between this analysis and the Final EA, largely attributable to the change from AEDT 3f to AEDT 3g, the change in emissions between the 2032 and 2037 Proposed Action and No Action Alternatives are on par with the Final EA. Furthermore, the dispersion modeling indicates that no localized exceedances of the NAAQS would be expected to occur during construction or after implementing the Proposed Action. Therefore, no significant impacts are expected to occur.

3.0 Human Health Risk Assessment

The purpose of the SEA HHRA is to assess the potential impacts to human health in surrounding communities associated with air pollutant emissions from SeaTac aircraft ground operations (i.e., taxiing and idling) and construction associated with the Proposed Action. For toxic air pollutants and human health evaluation, screening and decision benchmarks are explained in Section 2.1.5.2 and Table 2.5, and applied within HHRA methods. These comparisons collectively help determine whether predicted impacts are likely to be significant under SEPA. Methodologies used in this risk evaluation are reasonable and technically consistent with standard risk assessment practices and are appropriate under the SEPA.

3.1 Methodology

This section outlines the approach and methodologies used to perform the HHRA analysis. The HHRA focuses on human health cancer risks and acute and chronic hazards associated with airborne releases of TAPs during SEA's incremental changes in operation after completion of the Proposed Action. The HHRA methodologies are consistent with EPA risk assessment guidance (EPA 2009).

Identification of TAPs follows the same process outlined in **Section 2.1.2.1**. TAPs (listed in Table 2.1) for this HHRA are based on pollutants identified by the FAA and EPA guidance (FAA 2009; EPA & FAA 2009a, EPA & FAA 2009b) as found in jet aircraft exhaust, WADOE priority TAPs, inorganics/metals found in Jet A fuel, or Pb in aviation gasoline. Additionally, the identified TAPs also have ASILs, de minimis emissions, and/or SQERs published by WADOE (WAC 2019a). Finally, PSCAA published the findings of the Tacoma and Seattle Air Toxics Trends Technical Report in December 2023 (PSCAA 2023), which documents the results of monitoring for approximately 20 TAPs and associated potential cancer risks.

3.1.1 Exposure Assessment

Exposure is the process by which humans encounter chemicals in the environment. In general, humans can be exposed to chemicals through a variety of environmental media (e.g., soil, sediment, water, air, or food), and these exposures can occur through several routes (i.e., ingestion, dermal contact, or inhalation).

3.1.1.1 Exposure Populations of Interest

Exposure assessment begins by identifying and evaluating the off-airport exposure populations such as workers, residents (adults and children), and students. Potentially sensitive locations, such as hospitals and daycare facilities, are treated as either residential or school sites, respectively. Each receptor location represents a unique exposure population and sets of exposure conditions. They encompass a range of exposure scenarios for people who may be affected by SEA emissions to the greatest extent. Receptor location exposure scenarios were selected to provide risks and hazards estimates for the maximally exposed individuals (MEI) and to demonstrate the range of risks and hazards near SEA.

Risks for people recreating near the airport would be lower than those for workers, residents, and students at any given location because of much shorter times spent recreating. No risks were calculated for recreational receptors.

3.1.1.2 Relevant Exposure Pathways

Several exposure pathways could expose different human health receptors (e.g., off-site workers and school children) to TAPs of concern. Exposure scenarios are developed for each receptor considering various pathways through which each receptor may be exposed to TAPs of concern.

An exposure pathway consists of four parts:

- TAP source (e.g., fuel combustion)
- Release mechanism (e.g., aircraft engine exhaust)
- Means of transport from point of release to point of exposure (e.g., local winds)
- Route of exposure (e.g., inhalation)

Numerous possibly complete exposure pathways exist for receptors at or near SEA, but most make minimal to negligible contributions to total risks and hazards. For instance, if any of the four parts of the exposure pathway are absent, the pathway was considered incomplete and was not evaluated in the HHRA. Other exposure pathways may be complete but result in little or negligible risk. Finally, non-inhalation exposure pathways, such as dermal contact, incidental ingestion, and vegetable uptake, are generally found to be negligible compared to the contributions from the inhalation pathway and were not evaluated in the HHRA.

3.1.1.3 Contaminant Air Concentrations

Analyses of contaminant air concentrations are included in the exposure assessment for the receptor locations identified in **Section 2.1.4.6**. Acute and chronic exposure to TAPs from the construction associated with the Proposed Action and airport-related operations were estimated by:

- Estimating construction source emissions for peak annual and peak day averaging periods.
- Dispersion modeling of construction emissions over an area consisting of the airport property and proximal communities.
- Dispersion modeling of the Proposed Action incremental operational emissions over the same receptor locations as for the construction sources. The Proposed Action incremental operational emissions are the difference in emissions between the Proposed Action and the No Action condition emissions for a given year for each TAP.

Section 2.0 describes the methodologies for calculating emissions and dispersion of TAPs. Because the TAPs associated with construction and airport operations are generally subsets of PM_{10} and TOG emissions, the concentrations of TAPs were determined from concentrations of PM_{10} and TOG for each specific source type at each receptor location. The source types include the following:

- Turbofan, turboprop, and turboshaft aircraft engine and APU exhaust for aircrafts fueled with Jet A
- Piston aircraft engine exhaust for aircrafts fueled with aviation gasoline
- Diesel-fueled non-road GSE and construction equipment engine exhaust
- Gasoline-fueled non-road GSE and construction equipment engine exhaust

- Diesel-fueled on-road motor vehicle
- Gasoline-fueled on-road motor vehicles
- Construction dust emissions

Turbine aircraft and APU engine exhaust TOG were speciated into organic TAPs based on joint FAA/EPA studies conducted on aircraft engine exhaust measurements (EPA and FAA 2009b). The speciation profiles obtained from these studies are included in the EPA SPECIATE database as TOG Profile No. 5565. Turbine aircraft and APU engine exhaust are speciated into particulate matter TAPs based on data collected on Jet A engine exhaust by the U.S. Navy (Shumway 2000).

The on-road and non-road PM_{10} and TOG TAP speciation for both diesel-fueled and gasoline-fueled engines were developed from the MOVES model (Section 2.1.3 provides additional information on the modeling assumptions).

Once a given TAP concentration has been developed for each source type at each receptor location, the total TAP concentration at each receptor location was estimated by summing all the source type concentrations of that TAP. Resulting totals for a given TAP at each receptor location were used to determine the contaminant air concentrations for use in the exposure assessment.

In this HHRA, modeled air concentrations were evaluated for two exposure durations: acute and chronic. Acute exposure refers to exposures that occur over a duration of less than one hour up to a few days. Chronic exposure refers to exposures that occur over durations of one or more years. For risk calculations, acute contaminant air concentrations were computed based on a 1-hour averaging period, and chronic contaminant air concentrations were computed based on a 1-year averaging period.

Assessing risk from both acute and chronic perspectives is standard practice in HHRAs, consistent with established methodologies used by federal and state regulatory agencies, including EPA. This dual-pathway approach evaluates short-term exposures with immediate or rapid-onset health effects alongside long-term, cumulative exposures that may result in chronic health impacts such as cancer, organ toxicity, or systemic illness. Under SEPA, lead agencies are required to analyze the probable significant adverse impacts of a proposed action on human health, which necessarily includes consideration of both acute and chronic risk pathways to ensure a complete and accurate disclosure of potential effects.

3.1.2 Selection of Toxic Air Pollutants of Concern

TAPs of concern are chemicals that exist in the environment at concentrations that might be of potential health concern to humans, as identified based on a comparison to conservative health-based screening levels. TAPs of concern were identified for further evaluation in a quantitative risk assessment.

The TAP of concern selection process compared the maximum computed air concentration for each analyte across all receptor locations, all years (i.e., 2025 through 2037), and all scenarios (i.e., construction and operational years) to a conservative risk-based screening level. If the maximum air concentration exceeded the screening level, the chemical was selected as a TAP of concern. If the maximum air concentration did not exceed the screening level, the chemical is unlikely to pose any health risk, even to maximally exposed individuals (MEI), and it was not selected as a TAP of concern.

The screening levels used in the TAP of concern selection were obtained from Washington State ASILs (which are based on a target cancer risk of 1E-06 for carcinogenic ASILs and reference concentrations and reference exposure levels for non-cancer ASILs) (WAC 2019a). For each TAP, the maximum concentration across all years (i.e., 2025 through 2037) and scenarios (i.e., construction and operational years) for the appropriate averaging period was compared to its respective ASIL. This initial screen is similar to a first-tier review evaluation for toxic air pollution sources (WAC 2019b; WADOE 2015) and is technically consistent with standard practices. **Table 3.1** presents the results of the TAP of concern selection.

Table 3.1 Selection of Toxic Air Pollutants of Concern

TAP Common Name	CAS No.	Averaging Period	ASIL (µg/m³)	Maximum Concentration (µg/m³)	TAP of Concern?
Acetaldehyde	75-07-0	Yearly	0.37	0.044	No
Acrolein	107.02-8	24 hours	0.35	0.29	No
Benzene	71-43-2	Yearly	0.13	0.058	No
1,3-Butadiene	106-99-0	Yearly	0.033	0.056	**Yes**
Ethylbenzene	100-41-4	Yearly	0.4	0.0062	No
Formaldehyde	50-00-0	Yearly	0.17	0.40	**Yes**
Isopropylbenzene (Cumene)	98-82-8	24 hours	400	0.00036	No
Methyl alcohol (Methanol)	67-56-1	24 hours	20,000	0.22	No
Phenol	108-95-2	24 hours	200	0.087	No
Propionaldehyde	123-38-6	24 hours	8	0.094	No
Propylene	115-07-1	24 hours	3,000	0.56	No
Styrene	100-42-5	24 hours	870	0.037	No
Toluene	108-88-3	24 hours	5,000	0.10	No
1,2,4-Trimethylbenzene	95-63-6	24 hours	60	0.044	No
Xylenes	1330-20-7	24 hours	220	0.055	No
Naphthalene	91-20-3	Yearly	0.029	0.017	No
Diesel Particulate Matter	---	Yearly	0.0033	0.56	**Yes**

Selenium	7782-49-2	24 hours	20	0.000078	No
Vanadium[1]	7440-62-2	24 hours	1.0E-01	—	—
Sulfates	7446-11-9	1 hour	120	0.018	No

Key: — not available; µg/m³ – micrograms per cubic meter
Source: *WAC 2019a*
Note:
[1] Vanadium is not one of the chemicals in the speciation profile for emissions.

As seen, three TAPs were retained as TAPs of concern, including 1,3-butadiene, diesel particulate matter, and formaldehyde. Potential risks from TAPs not retained as TAPs of concern are likely to be small enough that they would not alter overall risk conclusions.

3.1.3 Evaluation of Toxic Air Pollutant Exposures

This section presents the basic equations used to estimate acute and chronic exposures from TAPs of concern for use in determining cancer risks and non-cancer hazards in the HHRA. This section also provides the exposure parameters for each receptor population.

Inhalation exposures were evaluated in accordance with the inhalation dosimetry methodology presented in EPA's *Methods for Derivation of Inhalation Reference Concentrations and Application of Inhalation Dosimetry* and *Risk Assessment Guidance for Superfund (RAGS), Part F: Inhalation Risk Assessment* (EPA 1994, 2009). In accordance with EPA, the human intake equation does not include an inhalation rate or body weight because the amount of the chemical that reaches the target site is not a simple function of these factors.

3.1.3.1 Exposure Concentrations

Acute Exposure Equations

Acute exposure refers to exposures that occur over a duration of less than 1 hour up to a few days. The inhaled exposure concentration (EC) for acute exposures is calculated as:

$$\mathbf{EC_{ac} = CA}$$

where EC_{ac} = acute exposure concentration (µg/m^3); and CA = concentration of chemical in air (µg/m^3) to which the person is exposed under an acute scenario.

The peak modeled 1-hour air incremental concentrations are used to estimate the acute ECs for TAPs of concern.

Chronic Exposure Concentrations

Chronic exposure refers to exposures that occur over durations of one or more years. Because the modeled air concentrations change each year, and differ by scenario, the chronic EC is calculated separately for each year and scenario. Total exposures averaged across the entire chronic exposure duration are calculated in the risk characterization. The inhaled EC for 1 year of chronic exposure is calculated as:

$$\mathbf{EC_{y,s} = C_{y,s} \times (ET \times EF \times 1 / AT)}$$

where $EC_{y,s}$ = chronic exposure concentration (µg/m^3), which is the annual time-weighted concentration for year "y" and scenario "s" based on the characteristics of the exposure scenario being evaluated; $C_{y,s}$ = concentration of the chemical in air (µg/m^3) to which the person is exposed for year "y" and scenario "s"; ET = exposure time (hours per day), which describes how long a person is likely to be exposed to the contaminated medium over the course of a typical day; EF = exposure frequency (days per year), which describes how often a person is likely to be exposed to the contaminated medium over the course of a typical year; AT = averaging time (hours), which specifies the length of time over which the time-

weighted average concentration is calculated (For non-cancer exposures, AT is equal to the receptor-specific exposure duration, expressed in hours; for cancer exposures, AT is equal to 70 years, expressed in hours [i.e., 613,200 hours]).

For mathematical convenience, the general equation for the annual time-weighted chronic exposure concentration can be written as follows:

$$\mathbf{EC_{y,s} = C_{y,s} \times TWF}$$

where TWF = annual time-weighting factor (unitless). The value of TWF is given by:

$$\mathbf{TWF = (ET \times EF \times 1 / AT)}$$

The peak annual average modeled air incremental concentrations are used to estimate the chronic exposure concentrations for TAPs of concern. Because the AT differs for cancer and non-cancer effects, the annual time-weighted chronic exposure concentration differs for cancer and non-cancer.

3.1.3.2 Exposure Parameters

For every human health receptor population of interest, it is expected there are differences between different individuals in the level of exposure at a specific receptor location because of the differences in exposure times, exposure frequencies, and exposure durations. Therefore, there is normally a wide range of average daily intakes between different members of an exposed population. For this reason, all daily intake calculations must specify what part of the range of doses is being estimated. Typically, attention is focused on intakes that are "average" or are otherwise near the central part of the range, and on intakes that are near the upper end of the range (e.g., the 95th percentile). These two exposure estimates are referred to as central tendency exposure (CTE) and reasonable maximum exposure (RME), respectively. For conservatism, RME receptors were evaluated in the HHRA.

For HHRAs, EPA defines a child receptor as an individual aged 0 to 6 years and an adult receptor as an individual aged 7 years and older, consistent with the standard default exposure factors established in EPA's *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (EPA 2014b) and applied throughout EPA's *Risk Assessment Guidance for Superfund* framework (EPA 1989). Because exposure parameters (e.g., exposure duration) may change as a function of age, residential exposure parameter values were selected separately for children (0 to 6 years) and adults (7+ years). **Table 3.2** lists the exposure parameters and resultant annual TWF values for each human health receptor population based on RME. Most of these values are based on EPA default guidelines, but some are based on professional judgment, or are estimated from exposure studies in the literature (EPA 1989, 2014b). The footnotes in the tables provide the basis and supporting rationale for each selected exposure parameter.

Table 3.2 Chronic Exposure Parameters for Each Human Health Receptor Population

Exposure Parameter		Units	Resident						School Child			Adult Off-Site Worker		
			Child			Adult								
			Value	Source	Notes	Value	Source	Notes	Value	Source	Notes	Value	Source	Notes
Inhalation of Air														
Exposure Time	ET	hours/day	24	1	a	24	1	a	8	3	c	8	1	a

Annual $TWF_{chronic,\ cancer}$		**unitless**	**1.37E-02**			**1.37E-02**			**2.15E-03**			**3.26E-03**		

Sources:
1. EPA 2014b.
2. EPA 1989.
3. Assumption
Notes:
a. Standard default value for residential exposure.
b. AT (hours) = ED x 365 days/year x 24 hours/day, where ED for non-cancer is set equal to the receptor-specific duration and ED for cancer is 70 years.
c. School child is at school for approximately 8 hours/day for 12 years (assumes Grades 1 through 12 are located at the same school). Exposure frequency assumes the school is open from August through May, excluding weekends and holidays.

3.1.4 Toxicity Assessment

The objective of a toxicity assessment is to identify the types of adverse health effects caused by a particular chemical and how the appearance of these adverse effects depends on exposure level. The toxic effects of a chemical frequently depend on the route of exposure (oral, inhalation, dermal) and the duration of exposure. Thus, a full description of the toxic effects of a chemical includes a listing of what adverse health effects the chemical may cause, and how the occurrence of these effects depends upon dose, route, and duration of exposure.

The toxicity assessment process is usually divided into two parts. The first characterizes and quantifies the non-cancer effects of the chemical, while the second addresses the cancer effects of the chemical. This two-part approach is used because there are typically major differences in the time course of action and the shape of the dose–response curve for cancer and non-cancer effects.

This section provides information on how non-cancer and cancer toxicity values were derived. It also presents the toxicity values used to quantify potential human health risks in the HHRA.

3.1.4.1 Non-Cancer Effects

Essentially, all chemicals can cause adverse health effects at a sufficient dose. However, when the dose is sufficiently low, typically no adverse effect is observed. Thus, in characterizing the non-cancer effects of a chemical, the key parameter is the threshold dose at which an adverse effect first becomes evident. Doses below the threshold are considered safe, while doses above the threshold have the potential to cause an effect.

The threshold dose is typically estimated from toxicological data (derived from studies of humans and/or animals) by finding the highest dose that does not produce an observable adverse effect and the lowest dose that does produce an effect. These are referred to as the no-observed-adverse-effect level (NOAEL) and the lowest-observed-adverse-effect level (LOAEL), respectively. The threshold is presumed to lie in the interval between the NOAEL and the LOAEL.

Separate effects thresholds are developed based on short-term (acute) and long-term (chronic) exposure durations. When evaluating chronic exposures, to be conservative (protective), non-cancer risk evaluations are not based directly on the threshold exposure level but on a value referred to as the reference concentration (RfC). The RfC is used to evaluate inhalation exposures and has units of mg/m^3. The RfC is an estimate (with uncertainty spanning potentially an order of magnitude) of a daily exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.

The RfC values are derived from the threshold dose by dividing by uncertainty factors (UF) and a modifying factor (MF) to account for limitations in the underlying toxicity data. UFs are assigned to account for variations in population sensitivity, uncertainty arising from extrapolation of animal data to humans, the use of a LOAEL instead of a NOAEL, the use of less than chronic exposure, and other limitations in the available data (e.g., lack of reproductive data). The combined UF is normally at least 10 but can be much higher if the data are limited. The MF is an additional adjustment factor that depends upon the professional assessment of scientific uncertainties of the study and database not explicitly

accounted for in the UFs (e.g., the completeness of the overall database and the number of species tested). The default value for the MF is 1.

The effect of dividing the threshold dose by the UFs/MF is to ensure that the RfC is not higher than the threshold level for adverse effects. Therefore, there is a "margin of safety" built into an RfC. Exposures equal to or less than the RfC are nearly certain to be without any risk of adverse effect. Exposures higher than the RfC may result in some risk, but because of the margin of safety, an exposure above the RfC does not mean that an effect will necessarily occur.

Similarly, when evaluating acute exposures, non-cancer risk evaluations are based on a reference level (REL). The acute REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration for the specified exposure duration on an intermittent basis. Different RELs can be developed specific to the exposure duration period of interest (e.g., 1 hour, 8 hours). For this evaluation, the 1-hour acute RELs are most useful for evaluating short-term emissions.

3.1.4.2 Cancer Effects

For cancer effects, the toxicity assessment process has two components. The first component is a qualitative evaluation of the weight of evidence (WOE) about whether the chemical does or does not cause cancer in humans. Previously, EPA performed this evaluation using the following system in **Table 3.3**:

Table 3.3 Previous Cancer Effects System

WOE Group	Meaning	Description
A	Known human carcinogen	Sufficient evidence of cancer in humans.
B1	Probable human carcinogen	Suggestive evidence of cancer incidence in humans.
B2	Probable human carcinogen	Sufficient evidence of cancer in animals, but lack of data or insufficient data in humans.
C	Possible human carcinogen	Suggestive evidence of carcinogenicity in animals.
D	Cannot be evaluated	No evidence or inadequate evidence of cancer in animals or humans.
E	Not carcinogenic to humans	Strong evidence that it does not cause cancer in humans.

EPA developed a revised classification system for characterizing the WOE for carcinogens (EPA 2005). However, this system has not yet been implemented for a number of chemicals, so the older classification scheme was retained for use in this assessment.

For chemicals that are classified in Groups A, B1, B2, or C using EPA guidelines, the second component of the toxicity assessment is to describe the carcinogenic potency of the chemical (EPA 1986). This is done by quantifying how the number of cancers observed in exposed animals or humans increases as the dose increases. Typically, it is assumed that the dose–response curve for cancer has no threshold, arising from the origin and increasing linearly until high doses are reached.

For inhalation exposures, cancer risk is characterized by an inhalation unit risk (IUR) value. This value represents the upper-bound excess lifetime cancer risk estimated to result from continuous lifetime exposure to a chemical at a concentration of 1 µg/m^3 in air.

3.1.4.3 Toxicity Values for Inhalation Exposures

Acute Values

The California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) has developed various acute and chronic RELs. The 1-hour RELs were used to evaluate acute exposures (OEHHA 2023).

Chronic Values

Toxicity values (RfC and IUR values) established by EPA are listed in the Integrated Risk Information System (IRIS) (EPA 2026e). Other toxicity values are available as interim recommendations from EPA's Superfund Technical Assistance Center operated by the National Center for Environmental Assessment (NCEA). EPA developed a toxicity value hierarchy for use in site-specific risk assessments (EPA 2003). This hierarchy provides an order of preference of toxicity values, with Tier 1 being the preferred source of toxicity information, if available, then Tier 2, followed by Tier 3. The recommended hierarchy of toxicity values is as follows:

- Tier 1 – EPA's IRIS: IRIS assessments have undergone external peer review in accordance with EPA peer review guidance at the time of the assessment. IRIS health assessments contain EPA consensus toxicity values.
- Tier 2 – EPA's Provisional Peer-Reviewed Toxicity Values (PPRTVs): The Office of Research and Development/NCEA/Superfund Health Risk Technical Support Center develops PPRTVs on a chemical-specific basis when requested by EPA's Superfund program.
- Tier 3 – Other Toxicity Values: Tier 3 includes additional EPA and non-EPA sources of toxicity information, such as the California Environmental Protection Agency and the Agency for Toxic Substances and Disease Registry (ATSDR). Priority should be given to those sources of information that are the most current, values that are publicly available and are transparent in their derivation process, and that have been peer-reviewed.

The EPA regional screening level (RSL) tables include a summary of toxicity values derived from these sources using this tiered system. EPA maintains and updates these tables biannually (EPA 2026f). All toxicity values used in this assessment were taken from the most recent version of the RSL tables (November 2024). For diesel particulate matter, EPA does not provide non-cancer or cancer toxicity values; therefore, the OEHHA IUR value was used (OEHHA 2026). **Table 3.4** presents the toxicity values used in this risk evaluation.

Table 3.4 Inhalation Toxicity Values

Toxic Air Pollutant	Acute	Chronic							
		Non-Cancer Toxicity Values				Cancer Toxicity Values			
	REL (1 hour) (mg/m^3)	Inhalation RfC (mg/m^3)	Composite UF	Target Organ	Source	IUR $(\mu g/m^3)^{-1}$		Source	WOE Description
1,3-Butadiene	6.6E-01	2.0E-03	1,000	Reproductive	I	3.0E05		I	Carcinogenic to humans
Diesel Particulate Matter	—	5.0E-03	30	Respiratory	C	3.0E-04		C	Likely to be carcinogenic to humans
Formaldehyde	5.5E-02	7.0E-03	—	Respiratory	I	7.4E-06	M	I	Carcinogenic to humans

Key: — not available; C – California Environmental Protection Agency; I – IRIS; M – mutagenic

3.1.5 Risk Characterization

This section provides a summary of the equations used to compute non-cancer hazards and cancer risks for TAPs of concern in the HHRA and describes how these results were interpreted.

3.1.5.1 Non-Cancer Effects

The potential for non-cancer effects from acute or chronic exposure to a TAP of concern is evaluated by comparing the estimated site-related exposure for a human health receptor over a specified time period to the effects threshold for that TAP of concern. This ratio of site-related exposure to the safe exposure level is called the hazard quotient (HQ). If an individual is exposed to more than one chemical, a screening-level estimate of the total non-cancer hazard is derived by summing the HQ values across individual chemicals and exposure pathways. This total is referred to as the hazard index (HI). If the HI value is less than or equal to (≤) 1, non-cancer hazards are not expected from any chemical, alone or in combination with others. The hazard evaluation performed herein is similar to a second-tier review evaluation for toxic air pollution sources (WAC 2019c). Thus, non-cancer HIs were interpreted based on a decision threshold of 1 when establishing the boundaries associated with SEA's TAP emissions.

The potential for acute non-cancer effects from inhalation exposures was evaluated by comparing the acute-specific EC to the 1-hour REL for that chemical, as shown:

$$\textbf{Acute HQ} = \textbf{EC}_{ac} / \textbf{REL}$$

where EC_{ac} = exposure concentration for acute exposure (mg/m^3); and REL = acute 1-hour reference exposure level (mg/m^3).

The acute HI at each receptor location was calculated by summing the acute HQs across all chemicals.

The potential for chronic non-cancer effects from inhalation exposures was evaluated by comparing the annual time-weighted chronic EC for non-cancer exposures to the RfC for that chemical, as shown:

$$\textbf{Chronic HQ}_{y,s} = \textbf{Non-Cancer EC}_{y,s} / \textbf{RfC}$$

where Non-cancer $EC_{y,s}$ = annual time-weighted chronic exposure concentration (mg/m^3) for non-cancer exposures for year "y" and scenario "s"; and RfC = inhalation reference concentration (mg/m^3).

The chronic HI for a given year and scenario was calculated by summing the chronic HQs across all chemicals at each receptor location. This chronic HI provides the hazard estimate for 1 year of exposure. To understand the total chronic non-cancer hazard for each human health receptor (e.g., child resident, adult resident, school child, and adult worker), chronic HIs at each receptor location were summed across their respective exposure duration (Table 3.2). For example, the exposure duration for a child resident is 6 years; thus, the total chronic HI for a child resident is estimated by summing across the chronic HIs for 6 contiguous years (e.g., 2025 to 2030, 2026 to 2031). If the exposure duration extends past 2037 (i.e., the last year that has modeled operations data), all subsequent years are assumed to have the same non-cancer HI as year 2037. Whichever contiguous exposure duration window for each receptor that results in the maximum total chronic non-cancer HI is presented to represent the MEI scenario. If the screening-level total chronic non-cancer HI is greater than 1, a refined HI is calculated, summing only across those chemicals that affect the same target organ system in the body.

3.1.5.2 Cancer Effects

The excess risk of cancer[5] from exposure to a chemical is described in terms of the probability that an exposed individual will develop cancer because of that exposure. Excess cancer risks are summed across all carcinogenic chemicals that contribute to exposure of an individual for a given population. The risk evaluation performed herein is similar to a second-tier review evaluation for toxic air pollution sources (WAC 2019c). As such, any individual TAPs with cancer risks greater than 1E-06 were identified as risk drivers, but cumulative cancer risks were interpreted based on a decision threshold of 1E-05 (i.e., 1 in 100,000) when establishing the boundaries associated with SEA's TAP emissions.

Cancer risks for each carcinogenic chemical are calculated as shown:

$$\textbf{Excess Cancer Risk}_{y,s} = \textbf{Cancer EC}_{y,s} \times \textbf{IUR}$$

where Cancer $EC_{y,s}$ = annual time-weighted chronic exposure concentration ($\mu g/m^3$) for cancer exposures for year "y" and scenario "s"; and IUR = inhalation unit risk $(\mu g/m^3)^{-1}$.

The cancer risk for a given year and scenario was calculated by summing across all carcinogenic chemicals at each receptor location. This cancer risk estimate represents 1 year of exposure. To understand the total cancer risk for each human health receptor (e.g., resident, school child, and worker), cancer risks at each receptor location were summed across their respective exposure duration (Table 3.2). For example, the exposure duration for a residential exposure scenario is 26 years (6 years as a child and 20 years as an adult); thus, the total cancer risk for a resident is estimated by summing across the child resident cancer risks for 6 contiguous years and adult resident cancer risks for 20 contiguous years (e.g., child from 2025 to 2030 and adult from 2031 to 2050). If the exposure duration extends past 2037 (i.e., the last year that has modeled operations data), all subsequent years are assumed to have the same cancer risk as year 2037. Whichever contiguous exposure duration window

[5] Excess cancer risk can be expressed in several formats. A cancer risk expressed in a scientific notation format as 1E-06 is equivalent to 1 in 1,000,000, or 10-6. Similarly, a cancer risk of 1E-04 is equivalent to 1 in 10,000, or 10-4. For this document, all cancer risks are presented in a scientific notation format.

for each receptor that results in the maximum total cancer risk is presented to represent the MEI scenario.

Toxic Air Pollutants with Mutagenic Modes of Action

For chemicals identified as having a mutagenic mode of action for carcinogenesis, cancer risks were estimated in accordance with the *Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens* (EPA 2005). When evaluating exposures to mutagenic chemicals, the default age-dependent adjustment factors (ADAFs) were applied to the cancer IUR to account for differences in potency that may occur from exposure during early life (up to age 16), as follows:

- 0 to <2 years: ADAF = 10
- 2 to <16 years: ADAF = 3
- Greater than or equal to (≥) 16 years: ADAF = 1 (i.e., no adjustment necessary)

EPA further indicates that any grouping of ages in the exposure assessment will need to be integrated with the ADAF age groupings to derive age group–specific risk estimates. For each year of exposure, the cancer risk by the inhalation pathway is computed as:

$$\textbf{Excess Cancer Risk}_{y,s} = \textbf{Cancer EC}_{y,s} \times \textbf{IUR} \times \textbf{ADAF}_i$$

where $Risk_{y,s}$ = excess cancer risk for year "y" and scenario "s"; Cancer $EC_{y,s}$ = annual time-weighted chronic exposure concentration ($\mu g/m^3$) for cancer exposures for year "y" and scenario "s"; IUR = inhalation unit risk $(\mu g/m^3)^{-1}$; and $ADAF_i$ = age-dependent adjustment factor for age interval "I" (unitless).

For example, for the 26-year residential exposure scenario, the first 2 years of childhood exposure are adjusted by a factor of 10, the next 14 years of child and adolescent exposure are adjusted by a factor of 3, and the last 10 years of exposure are not adjusted. Formaldehyde is the only TAP retained for quantitative risk characterization that is mutagenic.

3.1.5.3 Maximally Exposed Individuals

For the Proposed Action, grid points were analyzed within the study area. Concentrations of each TAP of concern at these receptor locations were used to calculate acute non-cancer HIs, total chronic non-cancer HIs, and cumulative cancer risks. These calculations were used to identify locations with maximum non-cancer health hazards and maximum cancer risks and serve as the basis for significance determinations.

MEI estimates were based on the land use for each receptor location. **Section 2.1.4.3** provides a detailed discussion of the systematic land use classification process. In brief, off-airport locations were identified based on available geographic information system data and internet web searches and reviews of receptor locations in Google Earth Pro, and land uses are designated as either residential, school (including day care and preschool), hospital (including older adult care), and commercial/industrial. These land use identifications were used to determine appropriate receptors (e.g., workers at commercial/industrial locations; adults and children at residential properties; students at schools). Locations of schools, hospitals, nursing homes, day cares, etc., were identified as sensitive

receptor locations, and these grid points were evaluated for both workers (teachers and staff) and residents (adults and children), and, when appropriate, school children.

3.2 Results

Appendix C presents the summaries of hazard/risk from acute and chronic exposure to TAPs of concern for residential children, residential adults, school children, and adult workers during construction conditions (2025 through 2032) and operation conditions (2032 through 2037).

3.2.1 Non-Cancer

3.2.1.1 Acute

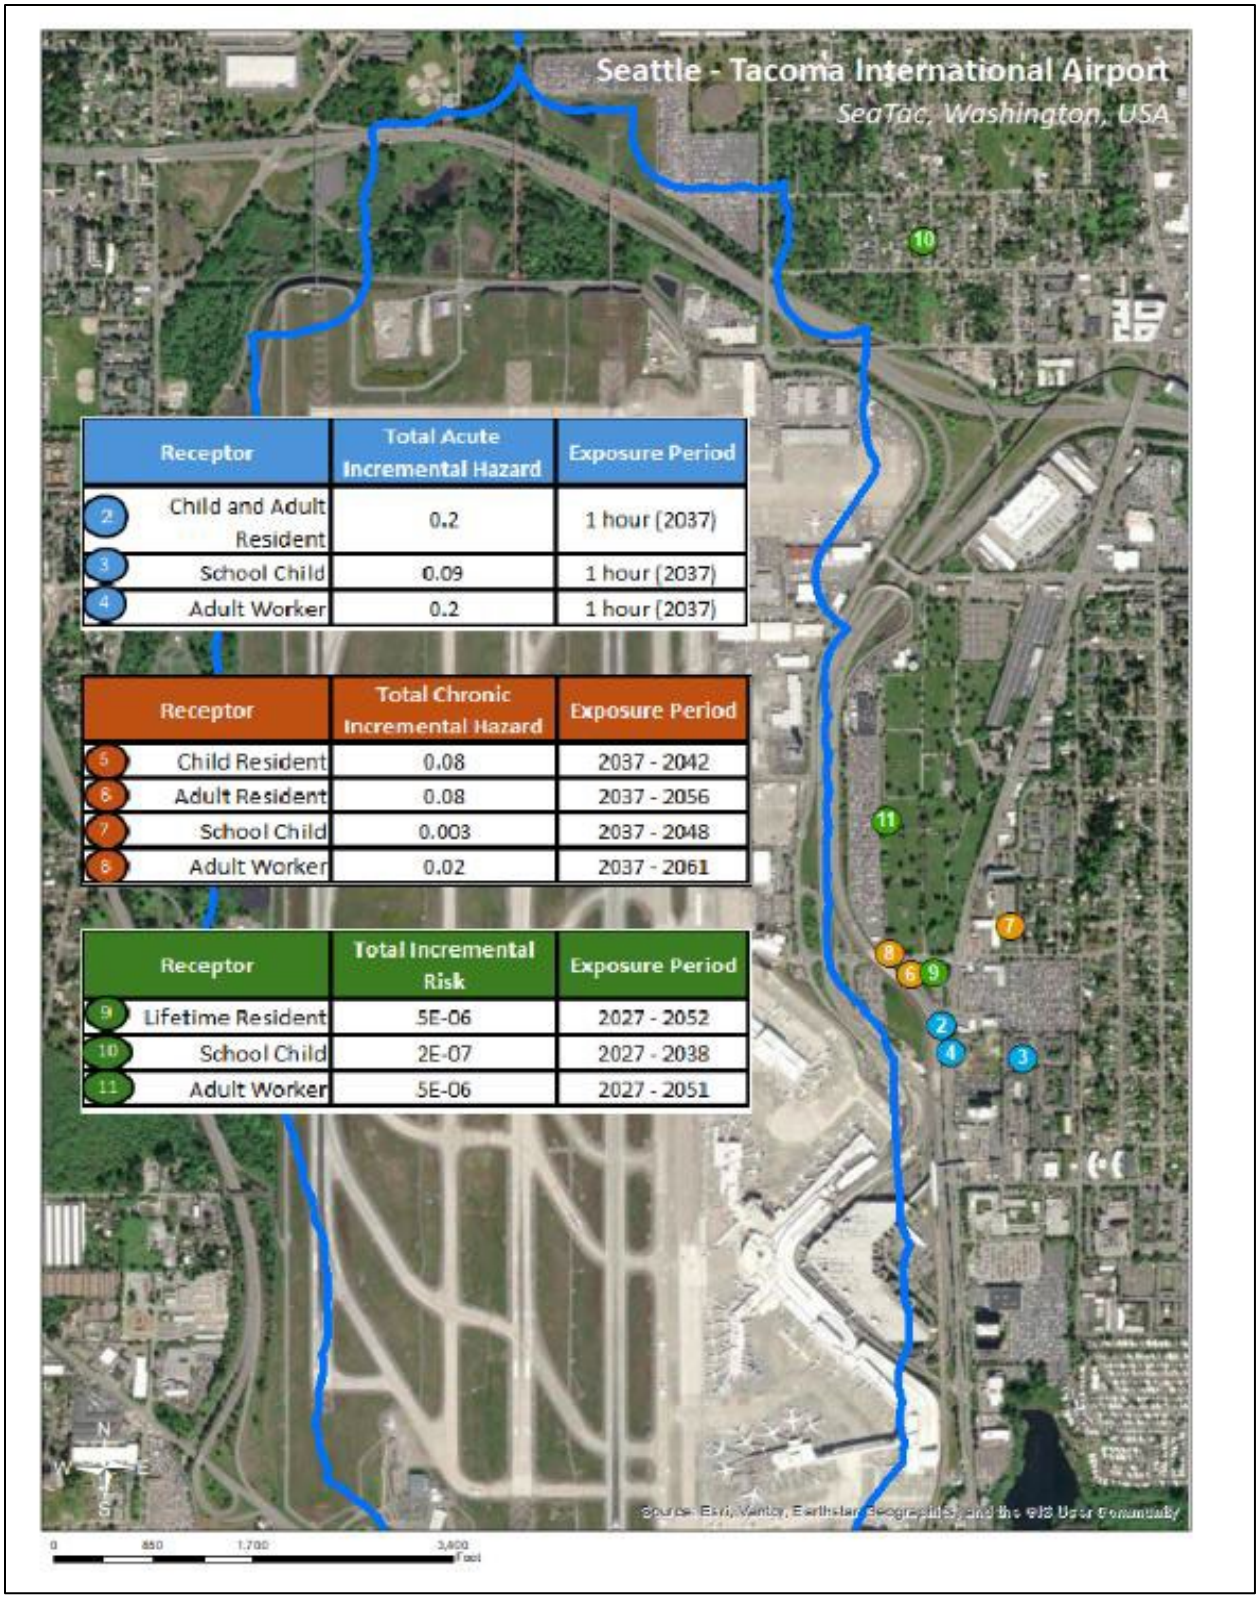
Table 3.5 summarizes the maximum acute non-cancer HIs associated with inhalation exposure for each year and scenario (construction and/or operations) across all human health receptors.

Figure 3.1 shows the MEI locations for each receptor based on acute hazards, chronic hazards, and chronic risks, indicated by the blue, orange, and green markers, respectively. Table insets in the figure detail the corresponding locations for each human health receptor, presents respective maximum hazards and risks for each human health receptor and scenario, and details the corresponding time frame for each maximum calculated hazard or risk.

Table 3.5 Maximum Acute Hazard Indices for Human Health Receptors

Year/Scenario	Maximum Acute HI	Maximum Location
2025 Construction	0.02	3592
2026 Construction	0.03	110
2027 Construction	0.03	3355
2028 Construction	0.04	3593
2029 Construction	0.07	3386
2030 Construction	0.08	3386
2031 Construction	0.04	3596
2032 Construction and Operations	0.08	156
2033 Operations	0.1	156
2034 Operations	0.1	156
2035 Operations	0.2	156
2036 Operations	0.2	156
2037 Operations	0.2	156

An acute HI greater than 1 indicates the potential for acute adverse health effects. As shown, no acute HIs exceed 1 (for any human health receptor), indicating that short-term exposures to TAPs of concern would not result in adverse health effects.



Note: Locations 5 and 6 are identical and are depicted by one orange marker denoted as "6."

Figure 3.1 Acute and Chronic Incremental Hazards and Chronic Incremental Risks to Maximally Exposed Individuals from Exposures to Toxic Air Pollutants of Concern

3.2.1.2 Chronic

Table 3.6 summarizes the maximum chronic non-cancer HIs associated with inhalation exposure for each receptor. Figure 3.1 shows the MEI locations for each receptor based on chronic non-cancer hazards, indicated by the orange markers.

Table 3.6 Maximum Chronic Hazard Indices for Human Health Receptors

Human Health Receptor	Exposure Duration (years)	Maximum Chronic HI	Maximum Location	Maximum Span of Years
Child Resident	6	0.08	3589	2037–2042
Adult Resident	20	0.08	3589	2037–2056
School Child	12	0.003	3	2037–2048
Adult Off-Site Worker	25	0.02	3591	2037–2061

A chronic non-cancer HI greater than 1 indicates the potential for chronic adverse health effects. Maximum incremental chronic non-cancer health hazards under the presented scenarios have no receptor locations where the chronic non-cancer HI exceeds 1, indicating that long-term exposures to TAPs of concern would not result in adverse non-cancer health effects.

3.2.2 Cancer Risk

Table 3.7 summarizes the maximum cumulative cancer risks associated with inhalation exposure for each receptor. Figure 3.1 shows the MEI locations for each receptor based on cancer risks, indicated by the green markers.

Table 3.7 Maximum Cumulative Cancer Risks for Human Health Receptors

Human Health Receptor	Exposure Duration (years)	Maximum Cancer Risk	Maximum Location	Maximum Span of Years
Lifetime Resident	26	5E-06	3589	2027–2052
School Child	12	2E-07	15	2027–2038
Adult Off-Site Worker	25	5E-06	266	2027–2051

A cumulative cancer risk greater than 1E-05 indicates the potential for chronic adverse health effects. Maximum cancer risks under the presented scenarios have no receptor locations where the cancer risks exceed the 1E-05 threshold, which indicates that exposures to TAPs of concern would not result in unacceptable lifetime cancer risks. The primary contributor to cumulative cancer risks is diesel particulate matter.

As shown in Table 3-6, the highest cancer risks were for the adult off-site worker during the 2027 to 2051 exposure period. **Figure 3.2** depicts the maximum cancer risks for the adult off-site worker at all receptor locations for the 2027 to 2051 exposure period to illustrate the spatial variability of estimated cancer risks.

Figure 3.2 Risks to Adult Off-Site Workers from Exposures to Toxic Air Pollutants of Concern

3.3 Uncertainty Analysis

An integral part of any risk assessment is the evaluation of uncertainties in the analysis, where major uncertainties associated with determining the nature and extent of the risk are identified and discussed. Uncertainties are inherent to all risk assessments because of the procedures used to obtain risk/hazard estimates. In general, exposure parameters, air concentration estimates, and toxicity values are intentionally selected to be overly conservative (i.e., using maximum concentrations for TAP of concern selection, using toxicity values with a built-in margin of safety). In using this conservative approach, it is likely that risk estimates presented herein are overestimating exposure potential and actual risks are likely to be lower.

The following section provides a detailed discussion of uncertainties (e.g., dataset gaps, TAP selection, exposure routes, modeling, and exposure parameters) and their potential impacts on the risk characterization.

3.3.1 Toxicity Criteria Uncertainty

Toxicity values are not available for acute exposures to diesel particulate matter. Although no strong conclusions can be reached regarding the potential for risk from chemicals without toxicity values, the magnitude of the error that results from excluding these chemicals is likely to be low. This is because the absence of toxicity information for a chemical is most often because toxicological concern over that chemical is low.

Toxicity information for many chemicals is often limited. Consequently, there are varying degrees of uncertainty associated with toxicity values. For example, uncertainties can arise from the following sources:

- Extrapolation from animal studies to humans
- Extrapolation from high dose to low dose
- Extrapolation from continuous exposure to intermittent exposure
- Limited or inconsistent toxicity studies

In general, uncertainty in toxicity factors is one of the largest sources of uncertainty in risk estimates at a site. Because of the conservative methods EPA and OEHHA use in dealing with these uncertainties, it is much more likely that the uncertainty will result in an overestimation rather than an underestimation of risk. For example, toxicity values like an IUR are conservatively derived using an upper confidence limit on dose–response data rather than an average to ensure the value reflects a health-protective estimate of risk even under uncertainty.

3.3.2 Selection of Toxicity Values

Washington State ASIL values were used for the TAP of concern selection but were not used in estimating acute hazards, chronic non-cancer hazards, and cancer risks. For the three TAPs of concern, Washington State ASIL values are based on the 1-year averaging period, which corresponds to chronic exposures and focuses on cancer risk effects, and there are no available ASIL values applicable to acute and chronic non-cancer hazard calculations. For this reason, the REL values were used for the acute

hazard calculations, and the EPA RfC and IUR values were used for the chronic non-cancer hazard and cancer risk calculations.

The Washington State ASILs for the three carcinogenic TAPs (established under WAC 173-460-150) are derived based on a target cancer risk level of 1E-06 and assume 24-hour exposures occur every day across the 1-year averaging period (i.e., a TWF of 1), consistent with the continuous exposure assumptions embedded in the IUR methodology. The ASILs do not specify the IUR used in their derivation. Therefore, the IUR used in the derivation of the ASIL can be established as:

$$\mathbf{IUR = TCR / ASIL_{annual}}$$

where IUR = inhalation unit risk $(\mu g/m^3)^{-1}$; TCR = target cancer risk (unitless; equivalent to 1E-06); and $ASIL_{annual}$ = 1-year averaging period ASIL value ($\mu g/m^3$).

For 1,3-butadiene, the Washington State ASIL of 0.033 µg/m³ (annual) implies an IUR of 3.03E-05 $(\mu g/m^3)^{-1}$, which is effectively equivalent to the EPA IRIS IUR of 3E-05 $(\mu g/m^3)^{-1}$, which was used in this HHRA.

The Washington State ASIL for diesel exhaust of 3.3E-03 µg/m³ (annual) implies an IUR of 3.03E-04 $(\mu g/m^3)^{-1}$, which is effectively equivalent to the OEHHA IUR of 3E-04 $(\mu g/m^3)^{-1}$, which was used in this HHRA.

For formaldehyde, the Washington State ASIL of 0.17 µg/m³ (annual) implies an IUR of 5.9E-06 $(\mu g/m^3)^{-1}$. The EPA IRIS IUR for formaldehyde was updated in 2024 and is 1.1E-05 $(\mu g/m^3)^{-1}$. The EPA IRIS IUR, which was used in this HHRA, is approximately 1.9 times more conservative than the IUR value underlying the ASIL.

In all instances, the IURs used in this HHRA are equivalent to or more conservative than the toxicity values underlying the applicable ASILs. The IURs used in this HHRA are technically appropriate, consistent with standard risk assessment practice, and sufficiently protective to satisfy the human health review standards applicable under SEPA.

3.3.3 Exposure Uncertainty

3.3.3.1 Exposure Pathways Not Evaluated

Humans may be exposed to chemicals by several pathways, but not all pathways were evaluated quantitatively in this risk assessment. In most cases, this is because the contribution of the pathway omitted is believed to be minor compared to one or more other pathways that were evaluated.

Omission of these minor pathways will result in a small underestimation of exposure and risk, but the magnitude of this underestimation is not expected to be significant. For example, this HHRA did not evaluate the deposition of TAP onto soils and subsequent exposure via incidental ingestion of this soil, uptake from soil into homegrown vegetables, and other indirect pathways. However, these were addressed quantitatively in HHRAs developed for other airports, including LAX and Oakland International Airport (CDM Smith 2023, CDM Smith 2012). In these HHRAs, screening-level studies for a large number

of TAPs were conducted to assess potential contributions to health risks for the following exposure media and routes: deposition onto soils and surfaces leading to exposure via dermal contact, incidental ingestion, and vegetable uptake; deposition and runoff to surface waters leading to exposure via ingestion; and airborne TAPs leading to exposure via inhalation. The screening level contributions for the non-inhalation pathways were found to be negligible compared to the contributions from the inhalation pathway, and the non-inhalation pathway risks would not change soil or water concentrations of the TAPs to levels above the typical background concentrations found in the western United States (CDM Smith 2023, CDM Smith 2012).

3.3.3.2 Human Exposure Parameters

Accurate calculation of risk values requires accurate estimates of the level of human exposure that is occurring. However, many of the required exposure parameters are not known with certainty and must be estimated from limited data or knowledge. The values used in the calculations are based mainly on standard default values used in Superfund HHRAs. In general, when exposure data were limited or absent, the exposure parameters were chosen in a way that was intended to be conservative. Because of this, the values selected are more likely to overestimate than underestimate actual exposure and risk.

3.3.4 Concentration Estimate Uncertainty

Inhalation exposures for populations of interest were evaluated using estimated air concentrations derived from air dispersion modeling. AERMOD is widely considered a scientifically credible and generally accurate air dispersion model for regulatory purposes when used correctly with high-quality input data, but its accuracy can vary depending on specific environmental conditions. AERMOD's performance is highly sensitive to the quality and resolution of meteorological data (wind speed, direction, temperature, cloud cover, etc.), land use parameters, and emission source data. When calculating the chronic EC estimates for each year, the annual average concentrations are used. Use of the average potentially masks short-term peaks or seasonal variations, which is why a separate short-term acute exposure scenario was also evaluated.

In typical risk assessments, exposure point concentrations are conservatively set equal to the 95% upper confidence limit (95UCL) on the mean to account for uncertainty and variability in the underlying data. Exposure concentrations in this HHRA are based on modeled values, which are averaged across either a 1-hour (acute) or 1-year (chronic) exposure period. Use of the simple arithmetic mean provides a best estimate of the true mean but exposures could be underestimated if there is a high variability in the underlying dataset.

When determining the MEI (Figure 3.1), the grid point with the highest hazards/risks was selected, which may not represent broader community exposure. In many instances, the maximum grid point may not represent a current exposure scenario (e.g., residential exposure scenarios were evaluated at all locations zoned for residential use, even if no residences are currently present). Additionally, the risk evaluation assumes the entire exposure duration occurs at a single grid point, which is unlikely to be a realistic assumption for the chronic exposure scenarios.

3.3.5 Risk Characterization

Because risk estimates for a chemical are derived by combining uncertain estimates of exposure and toxicity, the risk estimates for each chemical are more uncertain than either the exposure estimate or the toxicity estimate alone. Additional uncertainty arises from the issue of how to combine risk estimates across different chemicals. In some cases, effects caused by one chemical do not influence effects caused by other chemicals. In other cases, effects of one chemical may interact with effects of other chemicals, causing responses that are approximately additive, greater than additive (synergistic), or less than additive (antagonistic). In most cases, available toxicity data are insufficient to define what type of interaction is expected, so it is generally assumed that effects are additive for noncarcinogens that act on the same target tissue and for carcinogens (all target tissues). Because documented cases of synergistic interactions between chemicals are relatively uncommon, this approach is likely to be reasonable for most chemicals.

For noncarcinogens, summing HQ values across different chemicals is properly applied only to compounds that induce the same effect by the same mechanism of action. Consequently, summation of HQ values for compounds that are not expected to include the same type of effects or that do not act by the same mechanisms could overestimate the potential for effects. Thus, all the HI values in **Section 3.2.1** that sum HQ values across multiple TAPs of concern without regard to the target tissue are likely to overestimate the true level of human health non-cancer hazard.

3.3.6 Lead Toxicity

Risks from lead are evaluated using a somewhat different approach than for most other chemicals. First, because lead is widespread in the environment, exposure can occur from many different sources. Thus, lead risks are usually based on consideration of total exposure (all sources) rather than just site-related sources. Second, because studies of lead exposures and resultant health effects in humans have traditionally been described in terms of blood lead level, lead exposures and risks are typically assessed by modeling the levels of lead that may occur in the blood of exposed populations and comparing these to blood lead levels of potential health concern. For simplicity, and to keep focus on potential airborne exposures from SEA, estimated air concentrations for lead were directly compared to the NAAQS (**Section 2.1.5**) (i.e., lead risk estimates based on modeled blood lead levels were not derived).

3.4 Conclusions

Use of conservative modeling protocols and the compounding effect of combining exposure and toxicity uncertainty estimates likely result in an overestimation of the human health risk, potentially placing all modeled SEA maximum incremental risks below the decision thresholds. The calculated maximum incremental risks are considered conservative because they assume worst-case scenarios, such as high exposure concentrations (e.g., annual average concentrations), prolonged exposure durations (i.e., residents are assumed to be exposed for 24 hours a day for 350 days a year for 26 years), and direct proximity to the source of risk (e.g., receptor is breathing the air at one modeled grid location for the entire exposure period). Additionally, when deriving toxicity criteria, UFs are incorporated to account for limitations in the data, such as the uncertainty in extrapolating data obtained from a study with less-than-lifetime exposure or extrapolating from a low-effect level rather than from a no-effect level. These default factors are used to ensure a protective exposure level for the general human population,

resulting in a “health-protective” approach designed so that calculated hazards and risks are not underestimated, even if the assumption is not necessarily realistic.

The overall conclusions of the HHRA are as follows:

- **Acute Hazards:** Incremental acute non-cancer health hazards for all receptors are well below 1, indicating that short-term exposures to TAPs of concern would not result in adverse health effects.
- **Chronic Hazards:** Maximum incremental chronic non-cancer health hazards for all receptors are well below 1, indicating that long-term exposures to TAPs of concern would not result in adverse non-cancer health effects.
- **Cancer Risks:** Incremental cancer risks for all receptors are below the 1E-05 cancer risk threshold, which indicates that lifetime exposures to TAPs of concern would not result in unacceptable cancer risks.
- **Risk Overestimation:** Because of the combination of uncertainties in exposure and toxicity estimates and conservative modeling approaches, the calculated hazards/risks presented are likely to overestimate actual risks.
- **MEI Determination:** MEI is based on a receptor breathing air at one modeled grid location for their entire exposure period, which is unlikely for long-term (multiyear) exposure scenarios.
