**Subject:** SeaTac Fill

I commented to SeaTac about one of the fill reports, the Black?? site, virgin site. The soil sample came back with much higher than method B 100X ground water std. This site they want to keep because of the volume (200,000 to 300,000 cubic yards) and is workable during winter months. Beth Clark just called and set up a conference call with Paul Agid at 2:30 today to discuss possible solutions. My idea is to follow MTCA testing requirements WAC 173-340-740(7)(e) and (f).

I will defer decision until discussing it with you further.
