Subject: Third Runway Fill

Beth Clark called regarding the copper samples from the one site they want to use as a fill source. That is the site I flagged as over Method B copper for the protection of ground water. The new results, some 10 samples again show high copper values, ~70 to 100 mg/kg. She questioned the use of Method B protection of ground water. I repeated that was what we agreed on. She suggested we do not use the 100X ground water standard. I disagreed and reaffirm the std. She may call you later.
