**THIRD RUNWAY PROJECT  
OFF-SITE BORROW SOURCE BASELINE CHEMICAL CHARACTERIZATION  
BLACK RIVER QUARRY, RENTON, WASHINGTON**

This data package presents information compiled by Hart Crowser following the collection and chemical analysis of soil samples at the Black River Quarry for the Third Runway Project. The Black River Quarry is operated by City Transfer Incorporated (CTI) and is a source of soil borrow fill material for the Third Runway embankment that is currently being constructed at the Sea-Tac International Airport. Soils at the Black River Quarry consist of native sand and gravel derived from glacial and related alluvial deposits. Work for the project was completed pursuant to our contract with HNTB dated May 1, 1998, as amended, and the sampling and analysis strategy described in the Hart Crowser proposal dated October 5, 2001. Hart Crowser collected the samples on October 3, 2001, at the stockpile locations identified on Figure 1. All site sampling work was conducted following approval and site access authorization from CTI and the Black River Quarry personnel.

The objective of the pit sampling and analysis was to perform a baseline chemical characterization of *in situ* soils from active portions of the Black River Quarry. The soils were analyzed for total metals (priority pollutant metals plus barium) and total petroleum hydrocarbons. Additionally, Synthetic Precipitation Leaching Procedure (SPLP) analyses were conducted for any metal with a total metals concentration that exceeded fill screening criteria listed in the Port of Seattle's (Port's) Section 401 Water Quality Certification (Order #1996-4-0325, Amended -1) dated September 21, 2001.

Six representative soil samples from the Black River Quarry were submitted for laboratory analysis at North Creek Analytical, Inc. (NCA; Bothell, Washington).

This data package contains the following:

- **CHEMICAL ANALYSIS RESULTS AND CONCLUSIONS;**
- **SAMPLING METHODOLOGY AND SOILS DESCRIPTION;**
- **CHEMICAL DATA QUALITY REVIEW; and**
- **LIMITATIONS.**

Figure 1 is the Site Plan Schematic showing the stockpile that was sampled and the sample locations. Table 1 presents the total metals chemical analysis results. Table 2 presents soil sample descriptions.

Laboratory analytical documentation from NCA is presented in Appendix A.

## CHEMICAL ANALYSIS RESULTS AND CONCLUSIONS

Total metals results for the Black River Quarry soil samples, presented in Table 1, were compared against the Section 401 fill criteria (Condition E.1.B). As shown in Table 1, the chromium concentrations from samples BRQ-SP-Comp2 (44.7 mg/kg) and BRQ-SP-Comp6 (46.3 mg/kg) marginally exceeded the chromium fill criterion of 42 mg/kg. Copper concentrations from the six samples (97.5 to 131 mg/kg) exceed the copper fill criterion of 36 mg/kg.

As a result of the chromium and copper exceedences, samples BRQ-SP-Comp2 and BRQ-SP-Comp5 were analyzed for chromium and the six samples were analyzed for copper via SPLP in accordance with Attachment E of the Section 401 Certification (Section 401 Certification SPLP Work Plan). Chromium and copper were not detected in any sample above the reporting limit of 0.05 milligrams per liter (mg/L) using the SPLP methodology.

Based on a comparison of the nickel concentrations in samples BRQ-SP-Comp2 (49.3 mg/kg) and BRQ-SP-Comp3 (70.5 mg/kg) and a screening level of 48 mg/kg, these two samples were analyzed for nickel via SPLP in accordance with Attachment E of the Section 401 Certification (Section 401 Certification SPLP Work Plan). However, based on the fill criteria from Condition E.1.b of Section 401 Certification, the SPLP analysis of nickel was not required (see Table 1). Nickel was not detected in either sample above the reporting limit of 0.05 milligrams per liter (mg/L) using the SPLP methodology.

As discussed below in the **CHEMICAL DATA QUALITY REVIEW** section, Black River Quarry antimony sample analysis results from NCA laboratories were initially rejected based on failure of the laboratory quality control samples. Antimony analysis results for samples collected from five other off-site borrow sources (Kent Kangleay Pit, CTI Pit No. 3, Lakeland Hills Pit, Marine View Pit, and the Lincoln and Summit Stockpile) were also initially rejected, indicating a systematic laboratory condition. Soil samples from the Lakeland Hills Pit (LH Comp 5), the Kent Kangleay Pit (TP-2 Comp 1) and CTI Pit No. 3 (CTI Comp 6), were then resubmitted to Columbia Analytical Services, Inc. (CAS) laboratory for reanalysis of antimony. CAS analyzed each sample using the same extraction method (EPA Method 3050B) and similar analytical method (EPA 200.8 versus EPA 6020) that NCA used. In addition, the Kent Kangleay sample (TP-2 Comp 1) was extracted using an optional extraction procedure designed to improve to solubility and recovery of antimony (EPA Method 3050B; Section 7.5).

As described in the **CHEMICAL DATA QUALITY REVIEW** section of the Lakeland Hills Pit, CTI Pit No. 3, and Kent Kangle Pit baseline chemical characterization reports, the CAS antimony results were determined to be acceptable, based on the results of reanalysis. The analytical results from NCA and CAS are also well below the 401 Certification antimony fill criterion of 16 mg/kg. Because the CAS antimony results are acceptable, and are below the NCA Black River Quarry antimony reporting limits, the NCA Black River Quarry antimony results were also determined to be acceptable. Additionally, according to Shacklette and Boerngen's Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States (1984), the mean antimony concentration in the western U.S. is 0.47 mg/kg, and the observed range is less than 1 to 2.6 mg/kg.

In conclusion, the results presented in Table 1, along with the discussion in this section, show that the total metal concentrations in the soils from the Black River Quarry are less than those defined by the 401 fill criteria.

## **SAMPLING METHODOLOGY AND SOILS DESCRIPTION**

The following sections describe the specific exploration and sample collection methods used. This description includes sample handling and transfer, and decontamination procedures.

### ***Sample Collection and Soils Description***

Hart Crowser collected six composite samples from the Black River Quarry on October 3, 2001. Six samples were collected from the Black River Quarry active stockpile, which was approximately 64 feet long, 54 feet wide, with a stockpile face of approximately 48 feet at the time of sampling (Figure 1).

### **Stockpile Soil Samples**

The soil samples (BRQ-SP-Comp1 through BRQ-SP-Comp6) represent three-point composite samples. The approximate locations of the individual sample aliquots for each composite sample are shown on Figure 1. Each sample aliquot was collected at a minimum of about 1 foot below the surface. The Black River Quarry stockpile soils generally consisted of angular, cobbly, gravelly sand, representative of materials shipped for embankment fill for the Third Runway Project. These materials were derived from pit areas at the Black River Quarry

To form each composite sample, material at each sample aliquot location was collected using a stainless steel spoon and mixed together in a stainless steel

bowl, with each resulting composite sample was then transferred to pre-cleaned, labeled sample jars for laboratory analyses.

### **Sample Handling and Transfer**

After compositing each sample, each sample jar was wiped clean and capped with a Teflon-lined lid, and then placed in an insulated ice chest with ice.

Samples were shipped on October 4, 2001, to NCA under a chain of custody form for laboratory analyses. The samples were transported with blue ice and were received at the laboratory in good condition.

### **Decontamination**

Sampling equipment was cleaned prior to and between each sample. The spoons, bowls, and other hand sampling equipment were brush-scrubbed using an Alconox detergent solution followed by successive rinses of tap and deionized water.

## **CHEMICAL DATA QUALITY REVIEW**

This data quality review evaluates the data included in the NCA data groups B1J0132 and B1J0187. This data group includes data for soil samples collected at the Black River Quarry, the Lincoln and Summit Stockpile, and the Marine View Pit (Type 1B and II Soils). In total, 24 soil samples were collected for this data group on October 3 and 4, 2001, including the six samples from the Black River Quarry. These samples were analyzed for the following:

- Total Metals (silver, arsenic, barium, beryllium, cadmium, chromium, copper, mercury, nickel, lead, antimony, selenium, thallium, and zinc via EPA 6000 and 7000 series methods).

Following the above analyses, a subset of the 24 samples were further analyzed by NCA for leachable beryllium, cadmium, chromium, copper, and/or nickel using the SPLP procedure via method EPA Method 1312 metals (beryllium via EPA Method 6010B and cadmium, chromium, copper, and nickel via EPA Method 6020).

The following criteria were evaluated in the standard data quality review process:

- Holding times;

- Method blanks;
- Surrogate recoveries;
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries; and
- Laboratory relative percent difference (RPD).

**Total Metals.** All required holding times were met. No method blank contamination was detected. Lab control sample/lab control sample duplicate (LCS/LCSD) and MS/MSD recoveries were within control limits with the following exceptions. The percent recovery for barium in the MS/MSD samples prepared on October 10, 2001, was less than the control limit (33.3/38.3 percent versus 70 to 130 percent). MVP-1B-Comp 2 (Marine View Pit) was the only sample associated with the October 10, 2001, MS/MSD sample and the barium detection of 74.6 mg/kg was flagged as estimated ("J"). In addition, the percent recoveries for antimony in the MS/MSD samples (less than 5 percent) were significantly less than the control limit (70 to 130 percent). In addition, the MS/MSD RPD for antimony was greater than the control limit. A post-digestion spike on the same source sample that was used as the MS/MSD sample had an acceptable percent recovery for antimony. USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (dated February 1998) requires that non-detected results be rejected when the MS/MSD percent recoveries are less than 30 percent. Although it is not unusual for antimony recoveries to be low in many types of soil, the antimony MS/MSD recoveries are significantly below 30 percent requiring that all the antimony (non-detect) results be rejected. It should be noted, however, that antimony was not detected in any of the Black River Quarry soil samples. The soil quality data, with the exception of antimony, are acceptable for use as qualified.

**SPLP Metals.** All required holding times were met. No method blank contamination was detected. LCS/LCSD and MS/MSD recoveries were within control limits. The data are acceptable for use without qualification.

## LIMITATIONS

Work for this project was performed, and this report prepared, in accordance with generally accepted professional practices for the nature and conditions of the work completed in the same or similar localities, at the time the work was performed. It is intended for the exclusive use of the Port of Seattle for specific application to the referenced property. This report is not meant to represent a legal opinion. No other warranty, express or implied, is made.

Any questions regarding our work and this report, the presentation of the information, and the interpretation of the data are welcome. We trust that this report meets your needs.

Notes and Definitions

- Q-13     Multiple analyses indicate the percent recovery is outside the control limits due to a matrix effect.
- Q-15     Analyses are not controlled on matrix spike RPD and/or percent recoveries when the sample concentration is significantly higher than the spike level.
- DET      Analyte DETECTED
- ND        Analyte NOT DETECTED at or above the reporting limit
- NR        Not Reported
- dry       Sample results reported on a dry weight basis
- RPD      Relative Percent Difference
